PREFACE

In the preface to the preceding volume of this compilation it was mentioned that the plan of arrangement was being changed from alphabetical in accordance with the English names of the compounds, to alphabetical in accordance with the symbols of the elements. The chemical composition was thus made the basis of the arrangement instead of the names by which the compounds are known.

In this second volume a purely chemical classification has likewise been adopted. It consists in arranging the compounds in accordance with their increasing content of carbon, hydrogen and oxygen. In this way the position of each one is exactly fixed by its empirical formula and the uncertainty is avoided of choosing the best classifying name from the several by which many organic compounds can be correctly designated. The disadvantage of this plan is that empirical formulae are difficult to remember and hence are not easy to use for identifying compounds of carbon. To compensate for this deficiency and provide an additional means of locating desired results, a cross reference name index has been placed at the end of the volume.

In spite of the considerable progress which has been made in recent years in perfecting the rules for naming and representing the structural formulae of organic compounds, an entirely satisfactory system of their classification has still not been perfected. One of the best of those based upon nomenclature is that used by Dr. Austin M. Patterson in his table of Physical Constants of Organic Compounds, published on pages 484-747 of the 20th Edition of the Handbook of Chemistry and Physics, 1935, (Chemical Rubber Publishing Co., Cleveland, Ohio.) It is a pleasure to acknowledge the aid this table has been as a guide in selecting the preferred names and formulae of the compounds included in the present compilation. It has also been especially helpful in tracing the identity of compounds which have been referred to only by name in many of the original papers in which solubility results are given.

Although in most cases the name may be a sufficient identification, language differences and nomenclature revisions often add greatly to the difficulty of tracing the formula corresponding to a given name. The failure to record the structural formula as well as to specify the exact terms in which the results are expressed, may render the most careful work of little value.

Furthermore, results are often reported only in terms selected to demonstrate some theoretical relationship and insufficient details are

they were determined. This limits the use which might be made of them in the solution of other problems. It would indeed be a great advantage if the structural formula was given at least one time in every paper and the original numerical values in which the determinations were made, recorded in every case.

As in all previous editions of this compilation the question of where to draw the line in regard to results which are of sufficient interest to be included has been a difficult problem. The published results vary from the most accurate quantitative studies to simple observations of approximate solubilities under loosely controlled conditions. These latter are usually given in connection with descriptions of the preparation and properties of organic compounds and are thus very widely scattered in the literature. They have for the most part been incorporated in the descriptions of organic compounds given in Beilstein and other compendia. To have included them in this volume would have amounted to republication of information usually sought and easily found elsewhere. In general, therefore, it may be said that the present compilation is confined to results taken from original papers and having an interest from the quantitative solubility standpoint.

Solutions are in all cases mixtures from which the constituents cannot be separated mechanically. Solubilities express the amounts beyond which a given compound will not mix with one or more other compounds under fixed conditions. Due to the several states in which matter exists, solubilities may be of quite varied character. In general, however, the ordinary conception of solubility is limited to only a few of the numerous variations which are possible. It will probably be a surprise to some that so much space has been given in the present volume to freezing-points. They are, however, one of the most universal examples of quantitative solubility data. They differ from what is usually looked upon as solubility, in that the end point is reached in a different manner. Thus a mixture of two compounds rendered liquid by elevation of temperature, on gradually being cooled will reach a point, called the freezing-point, at which one or the other of the constituents will separate as a solid. This point represents the solubility of one compound in the other. The method involved differs principally from that ordinarily employed for solubility determinations in that the composition of the mixture remains constant while the saturation temperature is being approached, instead of the reverse procedure.

A very large number of solubility determinations made by the freezing point method are available, but for the most part they are not of as general interest as the results of the determinations made by the more familiar methods. Therefore, references only to such data are given

freezing-point may be the solute, references to each constituent are needed. In previous editions each system was recorded only under the name of that constituent the initial of which came first in the alphabet, and the name of the other constituent was given in the index. In the present volume an attempt has been made to record every system under the name of each of the constituents of which it is composed. Thus, in the case of all but a few of the more complex ones, there are assembled under every compound for which data are available, the names of all other compounds with which its freezing-point has been determined.

As in the case of the preceding volume the text of the present one has been prepared for planographic reproduction by combining the new data, typewritten on a "Varityper" and photographically reduced, with those tables of the previous editions which have not been superseded by more accurate determinations. The result leaves much to be desired from the point of view of typography, but, as in the case of the previous volume, this method was the only one of which the cost was not prohibitive. The main purpose has been to secure clearness, even at the expense of monotonous repetitions and uniformity of appearance. In view of the large numbers of results which have been collected and systematically arranged it can hardly be expected that complete freedom from typographical and other errors has been attained. The best that can be hoped is that very few of the errors which will inevitably be found will be of a misleading character.

A.S.

Washington, D. C., September 1, 1941.

ABBREVIATIONS

Most of the following abbreviations will be found written both with capitals and without.

- $[\alpha]_D$. — Specific Rotation.
 abs. — Absolute.
 abs. coef. — Absorption Coefficient.
 alcohol. — Ethyl Alcohol.
 amt(s). — Amount(s).
 anhy. — Anhydrous.
 aq. — Aqueous.
 atm(s). — Atmosphere(s).
 at. wt. — Atomic Weight.
 b.-pt. — Boiling-point.
 C. — Centigrade.
 calc. — Calculate(ed).
 cc. — Cubic Centimeter(s).
 cm. — Centimeter(s).
 coef. — Coefficient.
 com. — Commercial.
 compd. — Compound.
 conc. — Concentration, Concentrated.
 cond. — Conductivity.
 const. — Constant.
 cor. — Corrected.
 crit. — Critical.
 cryo. — Cryohydric.
 cryst. — Crystalline.
 d. — Dextro (in connection with the name of an optically active compound).
 d. — Density (d_{18} — Specific Gravity at 18°, referred to water at 4°; d_{20}^{20} at 20° referred to water at 20°).
 decomp. — Decomposition.
 dif. — Different.
 dil. — Dilute.
 dist. coef. — Distribution Coefficient.
 ed. — Edition.
 elec. — Electric(al).
 equil. — Equilibrium.
 equiv. — Equivalent(s).
 eutec. — Eutectic.
 F. — Fahrenheit.
 f.-pt. — Freezing-point.
 g., gm., gms. — Gram(s).
 gm. mol. — Gram Molecule(s).
 G. M. — Gram Molecule(s).
 hr(s). — Hour(s).
 i. — ($d + l$) Inactive (in connection with the name of an optically active compound.)
 inorg. — Inorganic.
 insol. — Insoluble.
 l. — Lævo (in connection with the name of an optically active compound).
 kg. kgm. — Kilogram(s).
 l. — Liter(s).
 mm. — Millimeter(s)
 m. — Meta.
 max. — Maximum.
 mg., mgm. — Milligram(s).
 mol(s). — Molecule(s), Molecular.
 mol. wt. — Molecular Weight.
 millimol. — Milligram Molecule.
 m.-pt. — Melting-point.
 n. — Normal (gm. equiv. per l.).
 N. — Normal (used rarely).
 o. — Ortho.
 ord. — Ordinary.
 org. — Organic.
 p. — Page.
 p. — Para.
 pet. — Petroleum.
 ppt. — Precipitate.
 pt. — Point.
 quad. pt. — Quadruple Point.
 qual. — Qualitative.
 sapon. — Saponification.
 sat. — Saturated.
 sol(s). — Solution(s).
 sp. gr. — Specific Gravity (Density).
 sq. cm. — Square Centimeter.
 s. — Symmetrical.
 sym. — Symmetrical.
 t°. — Temperature, Centigrade Scale.
 temp(s). — Temperature(s).
 tr. pt. — Transition Point.
 vol(s). — Volume(s).
 undissoc. — Undissociated.
 U. S. P. — U. S. Pharmacopœia.
 wt. — Weight.
 ∞ — Infinity.
 $\cdot 10^{-2}$, $\cdot 10^{-3}$, etc., following a result means that the decimal point is to be moved as many places to the left as indicated by the minus exponent.

CARBON Tetra BROMIDE CBr₄.SOLUBILITY OF CARBON TETRABROMIDE IN WATER.
(Gross and Saylor, 1931.)

The saturated solution was prepared by shaking in a thermostat and analyzed by means of an interferometer.

100 gms. H₂O dissolve 0.024 gm. CBr₄ at 30°.

Results for the fusion and transformation points of mixtures of CBr₄ + CCl₄ are given in the form of a diagram by Sohler, 1931. The determinations were made by recording with a thermocouple the temperature changes at regular intervals during the cooling and the heating of known mixtures of the two compounds. The curves for both fusion and transformation descend continuously from the fusion and transformation points of CBr₄ to those of CCl₄. At concentrations of CBr₄ greater than 75% decomposition prevented direct determinations of the fusion points.

Results are also given for the distribution of CCl₄ between aqueous 70% CH₃OH solution and mixed crystals of CBr₄ + CCl₄.⁴ In connection with these determinations an analytical method for determining the halogens in presence of each other is described.

Later studies of this system directed particularly toward determining the molecular size of the α polymorphic form of these compounds are given by Verstraete, 1934. Results for the distribution between the saturated vapor phase and mixed crystals of CBr₄ + CCl₄, containing 20% of CCl₄ are given.

CARBON TetrACHLORIDE

MISCIBILITY OF CARBON TETRACHLORIDE, WATER AND ETHYL ALCOHOL AT 0°.
(Bonner, 1910.)

Note.—The determinations were made by gradually adding ethyl alcohol to mixtures of the given amounts of water and the other constituent until a homogeneous solution was obtained. The results give the binodal curve for the system. The author also determined "tie lines" showing the compositions of various pairs of liquids which may exist in equilibrium. As the two layers approach each other in composition, the tie line is gradually shortened and finally reduced to a point, designated as the "plait point" of the binodal curve. This point is indicated by a * in the tables. The mixtures above and below the * correspond, according to their Sp. Gr., to the upper and lower layers of the system.

Di methyl ether of tetra ethylene glycol	CH ₃ O(CH ₂ CH ₂ O) ₄ CH ₃	30.2(2)
Di ethyl ether of di ethylene glycol	C ₂ H ₅ O(CH ₂ CH ₂ O) ₂ C ₂ H ₅	49.5(2)

(1) Vapor pressure of CCl₃F at 4.5°; (2) Gms. per 100 gms. solvent at 364 mm pressure and 32.2°.

DI CHLORO DI FLUORO METHANE CCl_2F_2 .

SOLUBILITY OF DICHLORO DIPLUORO METHANE IN ORGANIC SOLVENTS AT 32°.

(Zellhoeffer, 1937; Zellhoeffer, Copley and Marvel, 1938.)

Solvent	Formula	Gms. CCl_2F_2 per 100 cc solvent at 2693 mm pressure (1)
Carbitol Acetate	$\text{C}_2\text{H}_5\text{O}(\text{CH}_2\text{CH}_2\text{O})_2\text{COCH}_3$	25.8
Carbitol ethyl ether	$\text{C}_2\text{H}_5\text{O}(\text{CH}_2\text{CH}_2\text{O})_2\text{C}_2\text{H}_5$	38.0
Di ethyl ether of tetra ethylene glycol	$\text{C}_2\text{H}_5\text{O}(\text{CH}_2\text{CH}_2\text{O})_4\text{C}_2\text{H}_5$	25.8
Carbitol methoxy acetate	$\text{C}_2\text{H}_5\text{O}(\text{CH}_2\text{CH}_2\text{O})_2\text{COCH}_2\text{OCH}_3$	16.2
4-Methyl -2 pentanol acetate	$(\text{CH}_3)_2\text{CHCH}_2\text{CH}(\text{OOCCH}_2\text{CH}_3)$	52.0
2,3 Di β' ethoxy- β -ethoxy dioxane	$\text{C}_{12}\text{H}_{24}\text{O}_6$	19.6
y,y' Di chloro-n - propyl ether	$(\text{ClCH}_2\text{CH}_2\text{CH}_2)_2\text{O}$	22.0
Di chloro iso propyl ether	$(\text{C}_3\text{H}_7\text{Cl})_2\text{O}$	25.8
α Fluoro naphthalene	$\text{C}_{10}\text{H}_7\text{F}$	23.6
Tri chloro benzene	$\text{C}_6\text{H}_3\text{Cl}_3$	20.4
Ethyl ether or di ethylene glycolacetate	$\text{C}_2\text{H}_5\text{O}(\text{CH}_2\text{CH}_2\text{O})_2\text{COCH}_3$	26.7 (2)
Di methyl ether or tetra ethylene glycol	$\text{CH}_3\text{O}(\text{CH}_2\text{CH}_2\text{O})_4\text{CH}_3$	21.5 (2)
Di ethyl ether or di ethylene glycol	$\text{C}_2\text{H}_5\text{O}(\text{CH}_2\text{CH}_2\text{O})_2\text{C}_2\text{H}_5$	45.8 (2)

(1) Vapor pressure of CCl_2F_2 at 4.5°; (2) Gms. per 100 gms. solvent at 2693 mm. pressure and 32.2°.

TETRACHLORO ETHYLENE $\text{CCl}_2:\text{CCl}_2$.

Freezing-point data for mixtures of tetrachloro ethylene and tetra chloro ethane ($\text{C}_2\text{H}_2\text{Cl}_4$) are given by Timmermans and Mme. Vesselovsky, 1931.

DICHLORO TETRAFLUORO ETHANE $\text{C}_2\text{Cl}_2\text{F}_4$.

SOLUBILITY OF DICHLORO TETRAFLUORO ETHANE IN ORGANIC SOLVENTS AT 32°.

(Zellhoeffer, 1937; Zellhoeffer, Copley and Marvel, 1938.)

Solvent	Formula	Gms. $\text{C}_2\text{Cl}_2\text{F}_4$ per 100 cc solvent at 786 mm pressure (1)
Carbitol acetate	$\text{C}_2\text{H}_5\text{O}(\text{CH}_2\text{CH}_2\text{O})_2\text{COCH}_3$	16.2
Di methyl ether of tetraethylene glycol	$\text{CH}_3\text{O}(\text{CH}_2\text{CH}_2\text{O})_4\text{CH}_3$	13.8
Ethyl ether of di ethylene glycol acetate	$\text{C}_2\text{H}_5\text{O}(\text{CH}_2\text{CH}_2\text{O})_2\text{COCH}_3$	15.5 (2)
Dimethyl ether of tetra ethylene glycol	$\text{CH}_3\text{O}(\text{CH}_2\text{CH}_2\text{O})_4\text{CH}_3$	12.0 (2)
Diethyl ether of di ethylene glycol	$\text{C}_2\text{H}_5\text{O}(\text{CH}_2\text{CH}_2\text{O})_2\text{C}_2\text{H}_5$	30.0 (2)

(1) Vapor pressure of $\text{C}_2\text{Cl}_2\text{F}_4$ at 4.5°.

(2) Gms. per 100 gms. solvent at 786 mm pressure and 32.2°.

TRICHLORO TRIFLUORO ETHANE $C_2Cl_3F_3$.

SOLUBILITY OF TRICHLORO TRIFLUORO ETHANE IN ORGANIC SOLVENTS AT 32.2°.
(Zellhoeffer, Copley and Marvel, 1938.)

Solvent	Formula	Gms. $C_2Cl_3F_3$ per 100 gms. solvent(1)
Ethyl ether of di ethylene glycol acetate	$C_2H_5O(CH_2CH_2O)_2COCH_3$	33.0
Di methyl ether of tetra ethylene glycol	$CH_3O(CH_2CH_2O)_4CH_3$	27.5
Di ethyl ether of di ethylene glycol	$C_2H_5O(CH_2CH_2O)_2C_2H_5$	46.5

(1) At a pressure of $C_2Cl_3F_3$ corresponding to its vapor pressure at 4.5°.

CHLOROPICRIN (Trichloronitromethane) CCl_3NO_2 .

RECIPROCAL SOLUBILITY OF CHLOROPICRIN AND WATER. (Thompson and Black, 1920.)

Chloropicrin was shaken with a large amount of water to form an emulsion. The mixture was allowed to stand 3 days at room temperature and then maintained at 25° for 6 hours. The chlorine in 100 cc. of the solution was determined. A similar experiment was made at 0°. For the 75° result the solution sat. at 0° was kept 2 days in a thermostat at 75°.

t°.....	0°.	25°.	75°.
Gms. CCl_3NO_2 per 100 cc. H_2O	0.2272	0.1621	0.1141

For the determination of the solubility of water in chloropicrin, a small amount of water was dissolved in a large amount of chloropicrin and the mixture slowly cooled until a white cloud appeared. The temperature was then slowly raised until clearing occurred. The average of the temperature of clouding and of clearing was taken as the temperature of solubility.

t°.....	32°.	36°.	41°.	48°.	50°-8.	55°.
Gms. H_2O per 100 gms. CCl_3NO_2 .	0.1003	0.1185	0.1243	0.1647	0.1853	0.2265

Freezing-point data for mixtures of chloropicrin and nitrogen peroxide are given by Pascal, 1923.

Results for mixtures of chloropicrin and tetra nitro methyl aniline are given by Jefremow and Tichomirowa, 1928.

PHOSGENE (Carbonyl Chloride) $COCl_2$. (See also Vol. I, p. 237.)

VAPOR PRESSURES OF MIXTURES OF PHOSGENE AND VARIOUS SOLVENTS.
(Kirelew, Kaplan and Wasniewa, 1936.)

Instead of the direct method used by Atkinson, Heycock and Pope, 1920 and Baskerville and Cohen, 1921, for the solubility of Phosgene in various solvents (See Volume I, p. 237.) the authors made determinations of the differences in pressure of mixtures of phosgene and various solvents at several temperatures.

Results at -15° for mixtures of Phosgene and:

EQUILIBRIUM IN THE LIQUID AND VAPOR PHASES OF SYSTEMS (COMPOSED OF CARBON DISULFIDE AND ANOTHER SOLVENT.)

(Lewin, 1928.)

The determinations were made with the aid of a separatory funnel having a small bulb below the stop-cock and a similar one connected by a short tube with the stopper. The mixture was placed in the lower bulb and the funnel evacuated. The stop-cock was then opened and the mixture allowed to come to equilibrium with its vapor at a given temperature. The stop-cock was then closed, the funnel inverted and the vapor condensed in the bulb of the stopper by means of a freezing mixture. The composition of the two liquid mixtures thus obtained was determined by means of a Pulfrich refractometer.

(Gross and Saylor, 1931.)

SOLUBILITY OF WATER IN CHLOROFORM. (See also Vol. I, p.584.)
(Gibby and Hall, 1931.)

Mixtures of accurately weighed amounts of water and chloroform were warmed until the water dissolved and, while cooling, the temperature determined at which the first appearance of turbidity could be detected by observing from the side in a beam of light. The results when plotted give two lines which intersect at 0° , the point corresponding to the change from the solubility of ice to that of water. The authors failed to obtain the hydrate of chloroform reported by Chancel and Parmentier, 1885.

-1	0.014(1)	22	0.065	43	0.144
+3	0.019	23	0.072	54	0.165

(1) = Solid Phase, Ice.

100 cc 2.0 normal aq. sodium acetate solution dissolve 0.4 gm. $CHCl_3$ at about 18° . (Traube, Schöning and Weber, 1927.)

100 gms. aqueous 0.4 normal sodium oleate solution (=10.8 gms. Na oleate per 100 gms. solution) dissolve 20.6 gms. $CHCl_3$ at 20° . (Smith, 1932.)

SOLUBILITY OF CHLOROFORM IN WATER AND IN BLOOD.
(Winterstein and Hirschberg, 1927.)

The solutions were saturated both by shaking with an excess of $CHCl_3$ and by passing a current of air saturated with $CHCl_3$ vapor through or above the solution until saturated.

Solvent	t°	Gms. $CHCl_3$ per 100 gms. sat. sol.
Water	16-18	0.55
Physiol. salt sol. (0.85% NaCl)	"	0.50
Unchanged blood serum	"	0.56-0.77
Whole blood	"	0.75-0.86

The distribution of chloroform between blood corpuscles and blood liquid depends upon the concentration of $CHCl_3$. At concentrations near the saturation point the corpuscles absorb about twice as much as the plasma while at very low concentrations the corpuscles can absorb four to six times as much $CHCl_3$ as the plasma.

SOLUBILITY OF CHLOROFORM IN AQUEOUS ETHYL ALCOHOL, METHYL ALCOHOL, AND ACETONE MIXTURES AT 20°.

(Bancroft, 1895.)

In Ethyl Alcohol.		In Methyl Alcohol.		In Acetone.	
Per 5 cc. C ₂ H ₅ OH.		Per 5 cc. CH ₃ OH.		Per 5 cc. (CH ₃) ₂ CO	
cc. H ₂ O.	cc. CHCl ₃ .	cc. H ₂ O.	cc. CHCl ₃ .	cc. H ₂ O.	cc. CHCl ₃ .
10	0.20	10	0.10	5	0.16

0.20	20			0.16	5
0.125	30.24			0.12	10

Data for the system chloroform, ethyl ether and water are given by Jüttner, 1901.

Experiments by Schachner (1910) show that various fats (olive oil, sheep suet, goose fat) in an atmosphere containing 0.55% CHCl₃ vapor, dissolve 0.96-0.98 per cent CHCl₃ at 38.5°.

Data for the properties of solutions of CHCl₃ in water, saline solution, serum, hemoglobin, etc., in their relation to anesthesia are given by Moore and Roaf, (1904) and Waller (1904-05).

EQUILIBRIUM IN THE SYSTEM CHLOROFORM, ETHYL ALCOHOL AND WATER.

(Schoorl and Regenbogen, 1922.)

Mixtures of accurately measured volumes of the very carefully purified constituents were cooled to the appearance of milkiness and the temperature measured by a thermometer immersed in the mixture. The determinations were plotted and the following results for regular intervals of temperature obtained from the curves.

Ratio in cc. of H ₂ O to C ₂ H ₅ OH.		Cc. CHCl ₃ required to yield clouding at					
		0°.	10°.	15°.	20°.	25°.	66°.
80	20	—	0.7	—	—	—	—
66.7	33.3	0.7	1.0	1.3	1.6	1.9	—
60	40	1.5	2.2	2.5	2.9	3.2	—
50	50	6.35	7.6	8.2	8.9	9.6	14.0
33.3	66.7	20.8	22.9	23.9	24.9	25.9	—
Ratio in cc. of CHCl ₃ to C ₂ H ₅ OH.		Cc. H ₂ O required to yield clouding at					
		0°.	10°.	15°.	20°.	25°.	66°.
33.3	66.7	20.1	22.3	23.4	24.4	25.5	—
50.0	50.0	8.8	9.7	10.2	10.6	11.1	14.5
69.0	31.0	3.4	3.65	3.8	3.95	4.15	—
81.0	19.0	1.4	1.5	1.6	1.65	1.7	—

For a mixture of 50 cc. of H₂O + 50 cc. CHCl₃, 45 cc. C₂H₅OH are required to yield clouding at 66°.

It is pointed out that the difference between the present results and those of Bancroft are easily explained if Bancroft used alcohol containing 6% H₂O, instead of absolute.

CHLOROFORM CHCl₃.

SOLUBILITY OF CHLOROFORM IN ORGANIC SOLVENTS AT 32.2°.

(Zellhoeffer, Copley and Harvel, 1938.)

Solvent	Formula	Gms. CHCl ₃ per 100 gms. solvent(1)
Ethyl ether of di ethylene glycol acetate	C ₂ H ₅ O(CH ₂ CH ₂ O) ₂ COCH ₃	80.0
Di methyl ether of tetra ethylene glycol	(CH ₃ O) ₂ CH ₂ CH ₂ OCH ₂ CH ₂ OCH ₃	89.5
Di ethyl ether of diethylene glycol	C ₂ H ₅ O(CH ₂ CH ₂ O) ₂ C ₂ H ₅	87.5

(1) At a pressure of CHCl₃ corresponding to its vapor pressure at 4.5°.

(1) At a partial pressure of di chloro mono fluoro methane corresponding to its vapor pressure (0.847 atm.) at 4.5°. The vapor pressure of this compound is 2.221 atmospheres at 32.2°. The theoretical "Ideal" Mol. fraction is 0.381 in the saturated solution. This was calculated by using Raoult's law, and is the ratio of the vapor pressure of di chloro mono fluoro methane at 4.5° to its value at 32.2°.

SOLUBILITY OF DICHLORO MONOFLUORO METHANE IN ORGANIC SOLVENTS AT 32°.

SOLUBILITY OF IODOFORM IN GLYCEROL.

(Chiaria, 1917, 1919.)

Definite weights of 95 % glycerol ($d_{15} = 1.255$) and CH I₃ were heated 2 hours under a reflux condenser and the solution rapidly filtered and cooled to 15°. A definite weight of it was analyzed by adding standard silver nitrate and titrating the excess with sulfocyanate. The solubility was found to be 0.123 gms. CH I₃ per 100 gms. sat. sol. at 15°.

Increase in temperature or use of more concentrated glycerol did not greatly increase this result. (Chiaria, 1917, 1919.)

Freezing-point data for mixtures of iodoform and naphthalene gave a single eutectic at 70°.8 and 43.53 wt. per cent CH I₃. (Vasilév, 1916.)

HYDROCYANIC ACID CHN. (See also Vol. I, p. 569.)

At a pressure of CH₂ClF corresponding to its vapor pressure at 4.5°.

METHYLENE IODIDE (Diiodo methane) CH₂I₂.

1000 gms. H₂O dissolve 1.24 gm. CH₂I₂ at 30°. (Gross and Saylor, 1931.)

Freezing-point data are given by Timmermans, 1934, for CH₂I₂ + CHCl₃ over CH₂I₂ + CH₂Br₂.

CYANAMIDE CH₂N₂. (See also Vol. I, p. 216.)

Freezing-point data are given by Pratolongo, 1913, for CH₂N₂ + di-cyanamid and CH₂N₂ + Urea.

FORMALDEHYDE, Solid Polymers $(CH_2O)_n$.

SOLUBILITY OF THE SIX WELL-DEFINED SOLID POLYMERS OF FORMAL-
DEHYDE IN WATER. (Auerbach and Barschall, 1908.)

Name	Formula	m pt.	Gms. per 100 cc. Sat. Solution in Water.
Paraformaldehyde	$(CH_2O)_n + H_2O$	150-160	20-30 gms. at 18°
α Polyoxymethylene	$(CH_2O)_n$	163-8	11 gms. at 18-25°
β Polyoxymethylene	$(CH_2O)_n$	163-8	3.3 gms. at 18°, about 4 at 25°
γ Polyoxymethylene	$(CH_2O)_n$	163-5	less than 0.1 at 18°, 0.1 gm. at 25°
δ Polyoxymethylene	$(CH_2O)_n$	169-70	practically insoluble
α Trioxymethylene	$C_3H_4O_3$	63-4	17.2 at 18°, 21.1 at 25°

All are insoluble in alcohol and ether except trioxymethylene.

SOLUBILITY OF TRIOXYMETHYLENE IN Aq. SODIUM SULFITE SOLUTIONS AT 15°.
(Lumière and Seyewitz, 1902.)

Gms. Na_2SO_3 per 100 cc. H_2O	5	10	20	25	28 (sat.)
Gms. $C_3H_4O_3$ per 100 cc. sat. sol.	22	24	20	27	27

Data are also given for the solubility of various mixtures of trioxymethylene and sodium sulfite in water at 15°.

The distribution coefficient of formaldehyde between water and ether is 8.5 at 0° and 9.23 at 20°.
(Hantzsch and Vagt, 1901.)

FORMIC ACID $HCOOH$.

SOLUBILITY IN WATER, DETERMINED BY FREEZING-POINT METHOD. (Faucon, 1910.)

Carbon disulfide	4.66
Carbon tetrachloride	6.95
Cotton seed oil	0.77
Kerosene	1.56
Toluene	9.08
Xylene	7.29

FORMIC ACID HCOOH.

EQUILIBRIUM IN THE SYSTEM FORMIC ACID, ANILINE
AND WATER AT 15°.

(Pound and Wilson, 1935.)

The system is characterized by a region in which the components separate into two liquid layers and one in which crystals of aniline formate, C₆H₅NCH₂O₂, are formed. These liquid mixtures and solid crystals change continuously, producing formanilide and water. The crystals redissolve and the homogeneous liquid mixtures separate in time, into two layers.

The authors determined the binodal curve by titrating aqueous formic acid mixtures with aniline. The end point, shown by opalescence, could be determined to within one drop of aniline. Three tie lines showing the percentage of formic acid in adjoining layers were determined. Using these and the values for the binodal curve the following results for the composition of a series of liquid layers in contact with each other have been estimated.

Gms. per 100 gms. aqueous layer			Gms. per 100 gms. aniline layer		
HCOOH	C ₆ H ₅ NH ₂	H ₂ O	HCOOH	C ₆ H ₅ NH ₂	H ₂ O
0.0	3.6	96.4	0.0	95.0	5.0
4.0	12.0	84.0	0.65	93.5	5.85
5.5	15.5	79.0	1.7	91.0	7.3
7.1	21.0	71.9	3.8	83.5	12.7
8.3	28.5	63.2	6.0	72.0	22.0
8.5	41.0	50.5	7.4	62.0	30.6
8.2	50.0	41.8	8.2	50.0	41.8 P.P.

In addition to the binodal curve the authors determined the region in which aniline formate is formed. The saturated solutions were prepared by agitating known mixtures of aniline and formic acid at 15° for ½ hour or longer and analyzing the solution and the solid phase which separated. Points on the curve were also determined by titrating formic acid solutions with aniline at 15° until crystals remained in the solution and also by titrating aniline with formic acid solutions until crystals persisted. Although the appearance of the crystals varied with the different conditions under which they were formed, analysis showed them to be the formate in all cases. The following points on the curve were determined.

Gms. per 100 gms. sat. solution			Solid Phase
HCOOH	C ₆ H ₅ NH ₂	H ₂ O	
7.2	79.6	13.2	C ₆ H ₇ N.CH ₂ O ₂

The average value for the distribution of formic acid between water and chloroform at 25° was found by Smith, 1921-1922, to be 32.2 millimols HCOOH per liter of the H_2O layer and 1.0 millimol per liter of the $CHCl_3$ layer.

Results showing the distribution of formic acid between water and olive oil are given by Bodansky, 1928.

Data for the distribution of formic acid between ether and aq. 0.5 N H₂SO₄ containing 200 gms. of glucose per liter, are given by Auerbach and Beck, 1926. The experiments were made for the purpose of perfecting a method for the determination of formic acid in sugar containing foodstuffs such as honey, fruit juices and marmalades.

Data for the extraction of formic acid from water by ether are given by Dakin, Janney and Wakemann, 1913.

DISTRIBUTION OF FORMIC ACID BETWEEN WATER AND BENZENE AT 13-15°.
(v. Georgievics, 1913.)

A small separatory funnel was used and the acid in each layer titrated with 0.1 N NaOH, using phenolphthaleine as indicator.

* Critical Solution Temperature.

The author also studied the reciprocal solubility of Formic Acid and Tri Ethyl Amine but found that the addition compound which is formed separates into two liquid layers at the moment of fusion. The limits of reciprocal solubility in this system at the ordinary temperature are 1.4 and 39.2 gms. HCOOH per 100 gms. of the mixture.

The limit of reciprocal solubility of Formic Acid and Ethylene Bromide is at 51.5 percent HCOOH and 71.8°. (Lecat, 1930.)

The limit of reciprocal solubility of Formic Acid and n Pentane is at 10.0 percent HCOOH and 28°. (Lecat, 1930.)

Freezing-point data are given for:

METHYL CHLORIDE CH₃Cl.

SOLUBILITY OF METHYL CHLORIDE IN SEVERAL ORGANIC SOLVENTS. (Kling, 1915.)

The results are expressed in terms of $l_t = \frac{(V_t - V_0) T_t}{F_t} - (V_n - V_c) \div V_c$ in which V = volume of gas after absorption, V₀ = original volume of gas, T_t = temp. on absolute scale, F_t = temp. of thermostat, V_n = volume of the flask, V_c = volume of solvent.

l_t in each solvent determined separately.

The solubilities of CH_3Cl in the above solvents at one atmosphere pressure, in terms of the Ostwald Solubility Expression l (see p. 37 as calculated by Horiuti) are as follows

Solvent	l	Solvent	l
Acetone	69.3	Carbon Tetrachloride	40.9
Methyl Acetate	64.3	Benzene	55.9
Chloroform	67.6	Chloro benzene	47.2

The solubility of Methyl Chloride in Cyclohexanol ($C_6H_{11}OH$), in terms of the Ostwald Solubility Expression (the ratio of the volume (v) of gas absorbed to the vol. (V) of the absorbing liquid), is 17.7 at 26° . (Cauquil, 1927.)

Results for the solubility of Methyl Chloride in Fenchon ($C_{10}H_{16}O$) are given by Pasteur, 1931.

METHYL CHLORIDE CH₃Cl.

SOLUBILITY OF METHYL CHLORIDE IN ORGANIC SOLVENTS AT 32°.
(Zellhoeffer, 1937; Zellhoeffer, Copley and Marvel, 1938.)

METHYL CHLORIDE

Freezing-point data are given for:

$CH_3Cl + (CH_3OH)$ Methyl Alcohol
 " + $(CH_3)_2O$ Dimethyl Ether

(Baume et al., 1914.)
 " " " "

BROMO METHIONIC ACID $CHBr(SO_3H)_2$.

100 gms. H_2O dissolve 344.8 gms. $CHBr(SO_3H)_2$ at 25° . (Backer, 1929.)

CHLORO METHIONIC ACID $CHCl(SO_3H)_2 \cdot 2H_2O$.

100 gms. H_2O dissolve 344.0 gms. $CHCl(SO_3H)_2$ at 25° . (Backer, 1929.)

METHYL IODIDE CH_3I .

A sat. solution of methyl iodide in water at 25° has a $d_{4^\circ} = 2.18$ and contains 4.6 vol. % or 1.02 wt. % CH_3I .
 Fohner, 1923.)

100 gms. H_2O dissolve 0.0101 gm. mol. = 1.434 gm. CH_3I at 30° .
 (Van Arkel and Vlen, 1936.)

Freezing-point data are given for:

$CH_3I + CH_3OH$ (Methyl alcohol) (Baume and Tykociner, 1914.)
 $CH_3I + N_2O_4$ (Nitrogen peroxide) (Pascal, 1923.)
 " + C_5H_5N (Pyridine) (Aron, 1908-06.)

FORMAMIDE $HCONH_2$.

Solubility in Water, Determined by the Freezing Point Method.

* Critical solution temperature

Results for this system in terms of volume percent of the liquids are given by Jänecke, 1939. This author also gives complete results for the ternary system Formamide + Nitrobenzene + Hexane.

Freezing-point data are given for:

$HCONH_2$ + CH_3COOH (Acetic acid)	(English and Turner, 1915.)
" + n C_3H_7COOH (n Butyric acid)	" "
" + CS_2 (Carbon Disulfide)	(Joukovsky, 1934.)
" + $(C_2H_5)_2O$ (Ethyl Ether)	" "
" + C_6H_6 (Benzene)	" "
" + $C_6H_5NO_2$ (Nitro benzene)	" "

NITRO METHANE CH_3NO_2 .

Reciprocally saturated layers of nitromethane and water were each analyzed by means of viscosity measurements.

100 gms. sat. solution of nitro methane in water (upper layer)

contain 10 gms. $C_6H_5NO_2$ at 25° .

100 gms. sat. solution of water in nitro methane (lower layer)

contain 2 gms. H_2O at 25° . (Wright, Murray-Rust and Hartley, 1931.)

Determinations of the total and partial vapor pressures of mixtures of nitro methane and methyl alcohol and of nitro methane and ethyl ether at 20.5° are given by Joukovsky, 1934.)

Freezing-point data are given by Joukovsky, 1934, for:

CH_3NO_2 + $HCOOH$	(Formic Acid)
" + C_6H_6	(Benzene)
" + $C_6H_5NO_2$	(Nitro benzene)

The critical solution temperature of mixtures of Nitro methane and Tetra chlor ethylene is 41° . (Cornish, Archibald, Murphy and Evans, 1934.)

The limit of the reciprocal solubility of Nitro methane and:

Prim.i- Butanol is at 56.5 percent nitro methane and 17.0° .

i- Butyl carbinol is at 87.5 percent nitro methane and 13.5° .

Dimethyl ethyl carbinol is at 49.5 percent nitro methane and about 3° .
(Lecat, 1930.)

β = Bunsen Absorption Coefficient, which is the volume of gas (reduced to 0° and 760 mm) dissolved by 1 volume of the liquid when the partial pressure of the gas is 760 mm.

β' = is the same as β , except the measurements are at the total pressure of the gas plus liquid instead of at the partial pressure of the gas alone.

q = the weight of gas in grams dissolved by 100 gms. of pure solvent at the indicated temperature and total pressure of 760 mm.

SOLUBILITY OF METHANE IN AQUEOUS SOLUTIONS OF SULFURIC ACID AT 20° .

(Christoff, 1908.)

Gms. H_2SO_4 per 100 gms. aq. solvent	Gm. Mol. H_2SO_4 per liter solvent	β	l
35.82	4.64	0.01691	0.01815
61.62	9.55	0.01311	0.01407
95.6	18.0	0.03072	0.03303

β = Bunsen Absorption Coefficient

l = Ostwald Solubility Expression, which is the ratio of the volume (v) of gas absorbed at any pressure and temperature to the volume (V) of the absorbing liquid, i.e. $l = \frac{v}{V}$. This expression differs from the Bunsen Absorption Coefficient β , in that the volume V of the dissolve gas is not reduced to 0° and 760 mm. The solubility l is therefore the volume of gas dissolved by unit volume of solvent at the temperature of the experiment. The two expressions are related thus:

$$l = \beta (1 + 0.00367t), \quad \beta = \frac{l}{(1 + 0.00367 \cdot t)}$$

Using a special apparatus which permitted the agitation of a sample of air containing a known percentage of Pittsburgh natural gas (composed of 90 % CH_4 + 10 % C_2H_6) with water, and the removal of the sample for analysis after the period of contact with the water, the solubility coefficient α_{25} (= the volume of gas reduced to 0° dissolved by 1 vol. of H_2O at 25° , when the pressure of the gas over the water is 760 mm.) was found to be 0.032. (Milligan, 1924.)

SOLUBILITY OF MINE GAS (79.4 % CH₄ + 17.1 % N₂ + 2.8 % O₂ + 0.7 % CO₂)
IN WATER AND ORGANIC SOLVENTS UNDER PRESSURE.
(Fischer and Zerbe, 1923.)

An autoclave of 330 cc. capacity was used. Into this was placed 100 cc. of solvent and mine gas from a steel cylinder until a pressure of about 20 atmospheres was reached. The autoclave was then shaken at about 20° for 1½ hour. The pressure was then lowered to 1 atmosphere and a weighed amount of the solution analyzed for its contained gas. The results showed that although much nitrogen was present the absorbed gas contained the several constituents in approximately the same ratio as the used mine gas.

The author was interested principally in comparative values for various solvents.

SOLUBILITY OF METHANE IN ETHYL ALCOHOL.

(Bunsen, 1877, 1892.)

Abs. coef. β (found) 0.51721 0.50382 0.49264 0.48255 0.4729 0.4629

from which the following formula was calculated.

Bunsen abs. coef. β for methane = 0.522745 - 0.00295882 *t* - 0.0000177 *t*².

THE SOLUBILITY OF METHANE IN WATER AND IN ORGANIC SOLVENTS
AT 25° AND AT PRESSURES UP TO 140 ATMOSPHERES.
(Frolich, Tauch, Hogan and Peer, 1931.)

The determinations were made by shaking methane and each of the several solvents at various pressures in a steel cylinder maintained at 25° and, after attainment of equilibrium, withdrawing a sample of the mixture over mercury in one of three burets so designed that the volume could be measured with the same degree of accuracy at any ratio of gas to liquid. The results are given only in the form of a diagram from which the following approximate values were estimated.

Solvent	cc CH_4 (reduced to 25° and 760 mm) dissolved by 1.0 cc solvent at:					
	20	40	60	80	100	140 Atmospheres
Water	0.9	1.2	1.8	2.0	2.6	3.3

FREEZING-POINTS OF MIXTURES OF METHYL ALCOHOL, ETHYL ALCOHOL, AND WATER.
(Aldrich, and Qierfeld, 1931.)

The mixtures were made by diluting accurately measured volumes of the alcohols at 15.6° with water to a total volume of 100 cc at 15.6°. The concentrations are thus the volume percent of total alcohol present. The freezing-points are the averages of the temperature at which the first crystal appeared and that at which it just disappeared.

Vol. Percent CH ₃ OH in Alcohol Mixture	Freezing-point of aqueous Mixture Containing:

The authors also give results for the boiling points of the above mixtures.

FREEZING-POINTS OF MIXTURES OF METHYL ALCOHOL, GLYCEROL AND WATER.
(Feldman and Dehlstrom, 1936.)

A series of mixtures of CH₃OH + C₃H₅(OH)₂ were prepared by weighing and for each determination weighed amounts of these were added to weighed amounts of water. The freezing-point was taken as the temperature at which the last crystal disappeared on slow warming. The results were plotted and the following values for regular intervals of composition of the mixtures were taken from the curve.

Gms. CH ₃ OH per 100 gms. CH ₃ OH+C ₃ H ₅ (OH) ₂ Mixture (A)	Freezing-points of Mixtures Composed of:					
	80 Wt. % H ₂ O + 10 Wt. % (A)	80 Wt. % H ₂ O + 20 Wt. % (A)	70 Wt. % H ₂ O + 30 Wt. % (A)	60 Wt. % H ₂ O + 40 Wt. % (A)	50 Wt. % H ₂ O + 50 Wt. % (A)

NOTE.—The above determinations were made by gradually adding methyl alcohol to mixtures of given amounts of water and the other constituent until a homogeneous solution was obtained. The results give the binodal curve of the system. The author also determined "tie lines" showing the composition of each of two layers in contact with each other. These tie lines become shorter as the compositions of the pairs of liquids approach each other and finally are reduced to a point known as the "plait point" of the binodal curve. This point is marked by an * in the above table. The mixtures above and below the * correspond, according to their Sp.Gr., to the upper and lower immiscible layers of the system.

RECIPROCAL SOLUBILITY OF METHYL ALCOHOL, ETHYL ACETATE AND WATER
(Bech and Glastone, 1928.)

The binodal curve was determined by the titration method. The composition of conjugate layers was found by preparing mixtures of known amounts of the three components and analyzing the upper layer for acetate. These results and the solubility curve fixed the tie lines. The points at the extremities of these lines gave the compositions of conjugate layers.

RECIPROCAL SOLUBILITY OF METHYL ALCOHOL BENZENE AND WATER AT 20°.
(Perrakis, 1825.)

The amount of water required to produce clouding in various mixtures of methyl alcohol and benzene was determined by a titration method.

Gms. CH_3OH per 100 gms. $CH_3OH + C_6H_6$ mixture	Gms. H_2O to produce clouding per 100 gms. mixture	Gms. CH_3OH per 100 gms. $CH_3OH + C_6H_6$ mixture	Gms. H_2O to produce clouding per 100 gms. mixture

60.8	9.8	29.4	0.8718	4.05	95.67	0.28	0.87003
61.5	11.4	27.1	0.8675	4.22	95.48	0.30	0.86978
61.0	10.2	28.8	0.8700	4.09	95.63	0.28	0.8700

RECIPROCAL SOLUBILITY OF METHYL ALCOHOL BENZENE AND WATER AT 20°.
(Bancroft, 1895.)

H₂O was added to mixtures of known amounts of CH₃OH + C₆H₆ until clouding occurred.

Per 5 cc CH ₃ OH		Per 5 cc CH ₃ OH	
cc H ₂ O	cc C ₆ H ₆	cc H ₂ O	cc C ₆ H ₆
5.0	0.15	1.0	1.9
3.0	0.215	0.8	3.0
2.0	0.59	0.69	4.0
1.4	1.00	0.49	8.0

RECIPROCAL SOLUBILITY OF METHYL ALCOHOL, BENZENE AND WATER.
(Sata and Niwase, 1937.)

The temperatures were determined at which the mixtures of weighed amounts of the three constituents were homogeneous, opalescent or cloudy.

Gms. per 100 gms. mixture			Temperature of:		
CH ₃ OH	C ₆ H ₆	H ₂ O	Homogeneity	Opalescence	Cloudiness
72.4	25.3	2.3	27.0	26.0-23.5	23.0
72.3	25.2	2.5	29.0	28.1-27.0	26.0
72.0	25.1	2.9	—	—	30.0
64.45	32.25	3.30	24.0	23.0-21.1	19.0
64.44	32.21	3.35	28.0	27.5-24.5	23.5
64.36	32.17	3.47	33.0	32.0-26.5	24.0
64.28	32.13	3.59	36.0	35.0-29.0	28.0
64.19	32.09	3.72	37.0	36.5-32.0	31.0
64.10	32.00	3.90	—	— — —	30.0
57.40	38.20	4.40	31.0	30.0-26.5	25.5
57.30	38.10	4.60	26.0	24.8-22.8	22.0
57.20	38.10	4.70	—	— — —	30.0

Determinations of the Reciprocal Solubility in the systems:

Methyl Alcohol + $\frac{0}{p}$ Nitrophenol + Water
and " " + $\frac{p}{p}$ " " + " at 25° and at 40°.

are given by Duff, 1929. The systems yield immiscible layers over the lower concentrations of CH₃OH and C₆H₅NO₂.

RECIPROCAL SOLUBILITY OF METHYL ALCOHOL, NORMAL BUTYL
ALCOHOL AND WATER.

(Mueller, Pugsley and Ferguson, 1931.)

The binodal curves, tie lines and plait points were determined at temperatures between 0° and 105° . Both the titration method and observation of the temperature of changes in mixtures contained in sealed tubes were used. The compositions are given on the weight basis. The plait points were found by plotting and were also controlled experimentally. The sources of error and methods of overcoming them are described

RECIPROCAL SOLUBILITY OF METHYL ALCOHOL, METHYL BENZOATE AND WATER.
(Gilbert and Lauer, 1927.)

The determinations were made by the titration method. To a measured volume of one component in a large test tube, maintained at constant temperature, the other components were alternately added from burets, until, upon rapid stirring, the mixture became clear. Calculating from the densities of the liquids the measured volumes were converted to weights.

-1.6	37.9	2.3	62.9

RECIPROCAL SOLUBILITY OF METHYL ALCOHOL AND n HEXANE.
(Rothmund, 1898.)

The determinations were made by the synthetic method which consists in observing the temperatures at which weighed mixtures of the two liquids become homogenous on slow warming, and become cloudy on slow cooling.

t°	Gms. C_6H_{14} per 100 gms. $\overline{CH_3OH}$ rich layer $\overline{H_2O}$ rich layer		t°	Gms. C_6H_{14} per 100 gms. $\overline{CH_3OH}$ rich layer $\overline{H_2O}$ rich layer	
10	26.5	96.8	43	43.6	91.2
20	31.6	95.9	40	52.7	85.5
30	38.3	93.7	42.6 (C.S.T.)	68.9	

Additional results are given by Perschke, 1926, and Howard and Patterson, 1926.

Results for composition of the co-existent liquid and vapor phases in the system methyl alcohol + n hexane at 45° are given by Ferguson, 1932.

CRITICAL SOLUTION TEMPERATURES OF MIXTURES OF METHYL ALCOHOL
AND OTHER SOLVENTS.

(Cornish, Archibald, Murphy and Evans, 1934.)

Mixture	C.S.T.
$CH_3OH + C_2Cl_4$ (Tetra chlor ethylene)	10.0
" + $CH_3(CH_2)_3CH_3$ (<u>n</u> Pentane)	14.75
" + $CH_3(CH_2)_4CH_3$ (<u>n</u> Hexane)	32.0
" + " "	34.0 (Freed, 1933.)
" + $CH_3(CH_2)_5CH_3$ (<u>n</u> Heptane)	51.5
" + C_8H_{18} (1-Octane = 2.2.4-Tri methyl Pentane)	42.5

A diagram of the results showing the depression of the critical solution temperature (33.6°) of mixtures of Methyl Alcohol and Hexane, produced by increasing amounts of $C_5H_{11}COOH$, $C_6H_{13}COOH$, $C_7H_{15}COOH$ and $C_8H_{17}COOH$, is given by Ssementschenko, W. and Davidoffokaja, E., 1934.

Determinations of the Reciprocal Solubility of Methyl Alcohol and Tetra Ethyl Silan, $Si(C_2H_5)_4$, are given by Bjerrum and Jozefowitz, 1932.)

RECIPROCAL SOLUBILITY OF METHYL ALCOHOL AND CYCLOHEXANE.

(Jones and Ansell, 1930.)

The synthetic method was used and special care observed in purifying the CH₃OH and C₆H₁₂ and in preventing entrance of H₂O while weighing the liquids in the glass tubes which were afterwards sealed for observing the solubility limits.

t°	Gms. C ₆ H ₁₂ per 100 gms. mixture	t°	Gms. C ₆ H ₁₂ per 100 gms. mixture	t°	Gms. C ₆ H ₁₂ per 100 gms. mixture

* Critical solution temperature

The authors also determined the reciprocal solubility curves in mixtures made with CH₃OH containing small amounts of H₂O. The results show that the maximum critical point is increased more than the ternary critical solution point by given amounts of H₂O. In order to use this procedure for determining traces of H₂O in CH₃OH, the weight concentration of 75 percent C₆H₁₂ was selected and the following changes in maximum critical point with increasing amounts of H₂O were found.

Wt. % H ₂ O in CH ₃ OH	0.0	0.331	0.800	1.114	2.031	3.900
Max. crit. temp. of						
75 wt. % C ₆ H ₁₂ mixtures	45.55°	50.52°	55.74°	58.75°	66.50°	81.56°

The authors give similar results showing the effect of benzene and acetone admixtures upon the maximum critical temperatures of the system.

FREEZING-POINTS OF MIXTURES OF METHYL ALCOHOL AND:

(Saphir, 1929.)

UREA (Carbamide) $CO(NH_2)_2$.

SOLUBILITY OF UREA IN WATER.

The closely agreeing results of Pinck and Kelly, 1925; Jänecke and Rahlf, 1930; Schnidman and Sunier, 1932; Miller and Dittmar, 1934; and Wetrow, 1937, were plotted, and the following values taken from the smooth curve. In most cases the determinations were made by the synthetic method and in others by direct analysis of the saturated solutions using the urease method for urea. The earlier results of Speyers, 1902, are somewhat too low.

Very careful determinations of the freezing-point lowering in aqueous solutions of urea are given by Chadwell and Politi, 1938.

SOLUBILITY OF UREA IN AQUEOUS SOLUTIONS OF ACETIC ACID.

(Dalman, 1937.)

In the case of this system the urease method for urea gave incorrect results in presence of acetic acid and the determinations were made by removing this acid by evaporation to dryness at 50-60° and weighing the residue of dried urea.

Results for the equilibrium in the system Urea, Ammonia and Water, determined by the synthetic and freezing-point methods together with vapor pressures, fixing the range of existence of the solid phases, Urea, ammonium carbonate, bicarbonate, sesquicarbonate and carbamate are given by Jänecke, 1930, and Jänecke and Rahlfs, 1930, 1932.

SOLUBILITY OF UREA IN METHYL ALCOHOL. (Walton and Wilson, 1925.)

The saturated solutions were prepared by vigorous stirring at constant temperature. The solutions were analyzed by evaporating and weighing the residue. At the lower temperatures a stable molecular compound, $CO(NH_2)_2 \cdot CH_3OH$, is formed.

SOLUBILITY OF UREA IN ETHYL ETHER.

(Gortner, 1914.)

When 0.3255 gm. urea was extracted in a Soxhlet apparatus with anhydrous ether for 48 hours, the extract was found to contain 0.072 gm. urea. An approximate estimate, based on the volume of liquid and the number of siphonings per hour indicates a solubility of 0.0004 gm. urea per 100 cc. of ether.

100 gms. glycerol dissolve about 50 gms. urea at 15°.

100 gms. pyridine dissolve 0.96 gm. urea at 20-25°.

(Dehn, 1917.)

100 gms. aq. 50% pyridine dissolve 21.53 gms. urea at 20-25°.

Results for equilibrium in the system Urea + Di phenyl amine are given by Nijveld, 1934, and for the system Urea + Di phenyl amine + Resorcinol are given by Hyrnakowski, Staszewski and Szmyt, 1937.

SOLUBILITY OF UREA IN LIQUID AMMONIA.

(Scholl and Davis, 1934.)

From the volume and pressure of the vapor above the saturated solutions at given temperatures, determined in an isotensiscopes, the amount of NH_3 was calculated and this subtracted from the weight of liquid ammonia present in the original mixtures, to find the composition of the saturated solutions. Previous determinations of this system by Jänecke, 1930, agree well with the present results.

Results are also given for the fusion points of the system $CO(NH_2)_2 + CO(NH_2)_2 \cdot H_3PO_4$. The eutectic is at 72° and 37 percent $CO(NH_2)_2$.

NITROGUANIDINE $NH_2 \cdot C(NH) \cdot NH \cdot NO_2$.

One liter of saturated solution of Nitroguanidine in Water contains 4.4 gms. $CH_4O_2N_4$ at 25° and 82.5 gms. at 100°.

One liter of saturated solution in aqueous 1.0 normal KOH contains 12.2 gms. $CH_4O_2N_4$ at 25°. Some decomposition occurs as indicated by the evolution of ammonia. There are two forms of nitroguanidine which differ slightly in solubility. (Davis, Ashdown and Couch, 1925.)

SOLUBILITY IN AQUEOUS SOLUTIONS OF SULFURIC ACID.

Results at 0° and at 25°.

(Davis, 1922.)

Results at 13°.

In the case of the determinations by Davis an excess of solid was shaken with the aqueous acid and the saturated solution analyzed. The determinations by Ewan and Young were made by adding 82 % H_2SO_4 to definite mixtures of nitro guanidine and water until the solid just dissolved. These authors also give a few determinations made with aqueous nitric acid mixtures.

METHIONIC ACID CH₂(SO₃H)₂

100 gms. H₂O dissolve 245.8 gms. CH₂(SO₃H)₂ at 25°. (Backer, 1929, 1930.)

METHYL AMINE CH₃NH₂.

The solubility of methyl amine in water at 60°, determined by an aspiration method and calculated from the vapor pressure of 40.6 mm Hg, is 419 in terms of the Bunsen Abs. Coef (see p.37) and 511 in terms of the Ostwald Solubility Expression (see p.37) (Doyer, 1890)

Freezing-point data for mixtures of CH₃NH₂ + H₂O are given by Pickering, 1893.

HEXA CHLORO ETHANE $\text{CCl}_3:\text{CCl}_3$.

Results for the solubility of hexa chloro ethane in ethane, liquid and vapor, over a temperature range from 40° to 50° are given by Holder and Maass, 1940. An apparatus consisting of a central main phosphor bronze bomb in which the solvent and solute were placed and to which two small bombs equipped with needle valves were attached, was used for measuring the solubilities both in the liquid and vapor phases up to and above the critical temperature.

The critical solution temperature of this system $\text{C}_2\text{Cl}_6 + \text{C}_8\text{H}_{10}\text{O}_4$ (ethyl oxalate) is at about 105° . (Lecat, 1928.)

Results for the melting points of the system $\text{CCl}_3:\text{CCl}_3 + \text{C}_{10}\text{H}_8$ (Naphthalene) are given by Parijs, 1936.

TETRA CHLORO DINITRO ETHANE $\text{C}_2(\text{NO}_2)_2\text{Cl}_4$.

30 cc. of dry nitrogen peroxide (N_2O_4), distilled from P_2O_5 , dissolve 15.7 gms. $\text{C}_2(\text{NO}_2)_2\text{Cl}_4$ at 0° . The solubility of tetrachlor dinitro ethane in superpalite and in chlorpicrin is about of the same order of magnitude.

(Argo, James and Donnelly, 1919.)

CYANOGEN AZIDO DITHIOCARBONATE $\text{CN}:\text{SCSN}_3$.SOLUBILITY OF CYANOGEN AZIDO DITHIO-CARBONATE IN
SEVERAL SOLVENTS AT 0° .

(Audrieth and Browne, 1930.)

Solutions saturated at room temperature were cooled in an ice bath and after crystallization 5 cc samples of the supernatant liquid were withdrawn, the solvent removed by evaporation, and the residue weighed.

TRI BROMO DI CHLORO ETHANES

Freezing-point data for the system $\text{CH Br}_2 \cdot \text{C Cl}_2$ Br + $\text{CH Cl Br} \cdot \text{C Cl Br}_2$ are given by Van de Walle, 1925.

PER CHLORO ETHANE CCl_3CCl_3 .

100 gms. H_2O dissolve 0.005(?) gm. CCl_3CCl_3 at 22.3°. (Van Arkel and Vles, 1936.)

PENTA CHLORO ETHANE $\text{CHCl}_2\text{CCl}_3$.

100 gms. H_2O dissolve 0.047 gm. $\text{CHCl}_2\text{CCl}_3$ at 20°. (Van Arkel and Vles, 1936.)

The critical solution temperature of mixtures of Penta chloro Ethane and Acetamid is at about 95°. (Lecat, 1928.)

Freezing-point data are given for the systems C_2HCl_5 + $\text{CH}_2\text{ClCH}_2\text{Cl}$ (Ethylene Chloride) and C_2HCl_5 + $\text{CHCl}_2\text{:CHCl}_2$ (1,1,2,2-tetrachloro ethane) by Timmermans and Mme. Vesselovsky, 1931.

TRI CHLORO ETHYLENE C_2HCl_3 .

SOLUBILITY OF WATER IN TRI CHLORO ETHYLENE.
(Carlisle and Levine, 1932.)

The authors give their results in the form of a curve from which the following results were read.

SOLUBILITY OF ACETYLENE IN AQUEOUS SOLUTIONS OF PRUSSIAN BLUE.

(Gatterer, 1926.)

The Prussian Blue solution (Ferri ferrocyanide) was prepared by mixing 2.0 normal sodium ferrocyanide and ferric chloride, washing the resulting precipitate, redissolving in a small quantity of ferrocyanide solution and evaporating in a vacuum to a concentration of about 8 per cent. For purposes of calculation the gram equivalent of Prussian Blue was taken as $\frac{1}{2}\text{Fe}_4[\text{Fe}(\text{CN})_6]_3 = 71.603$. The solubility of the acetylene is given in terms of the *Ostwald Solubility Expression I*, which is the volume of gas dissolved by unit volume of solvent at the temperature of the experiment.

Normality of Prussian Blue Solution.	Solubility I of C ₂ H ₂ at

SOLUBILITY OF ACETYLENE IN AQUEOUS SOLUTIONS OF FERRIC HYDROXIDE.

(Gatterer, 1926.)

In order to prepare the solvents a solution of pure ferric hydroxide in acetic acid was diluted and boiled until the ratio of acetic acid to ferric hydroxide became 1:30-1:60. It was then evaporated under reduced pressure, whereby a much higher degree of dispersion, as shown by the Tyndall effect, was obtained. The gram equivalent of the ferric hydroxide was taken as $\frac{1}{3}\text{Fe}(\text{OH})_3 = 35.621$.

SOLUBILITY OF ACETYLENE IN AQUEOUS SOLUTIONS OF SALTS AT 25°.

(Manchot, Jahrstorfer and Zepter. 1924.)

NOTE. — An apparatus designed to eliminate the disadvantages of the Ostwald type was used. The gas volumes were measured in a water-jacketed mercury sealed gas buret. An absorption flask, provided with a separate receptacle for the solvent, was connected to the gas buret by glass tubing made sufficiently flexible either by a grid or by two short rubber connections. The apparatus was filled with the pure gas and this then saturated with the vapor of a small portion of the solvent. The reading was taken and the main portion of the solvent introduced and the volume of gas that it dissolved measured directly. The rubber connections of the apparatus were soaked in paraffine to render them impervious to the gas.

The authors desired to compare the amount of gas dissolved per unit weight of water in the salt solutions employed, rather than per unit volume of solution. The densities of the salt solutions were, therefore, determined. The original tables show the *absorption coefficient a* (See p. 71) calculated not only to unit

volume of solution but also to unit weight of solution. Further calculations permitted deductions in regard to the H_2O of hydration of the salts studied.

50	—	—	—	—	2.628
60	—	—	—	—	2.386
70	—	—	—	—	2.180

The Ostwald Solubility Expression l is the ratio of the volume (v) of the gas absorbed at any pressure and temperature to the volume (V)

TETRA BROMO ETHANE \leq CHBr₂.CHBr₂.

1000 cc H₂O dissolve 0.651 gm. \leq CHBr₂.CHBr₂ at 30° as determined by interferometer measurement. (Gross, Saylor and Garman, 1933.)

Freezing-points of the system \leq CHBr₂.CHBr₂ + CH₂Cl.CH₂Cl (1.2 dichlor ethane) are given by Timmermans and Mme Vesselovsky, 1931.

DI CHLORO ETHYLENE sym. and unsym., CHCl:CHCl, CH₂CCl₂.

Freezing-point data are given by Timmermans, 1927, for each of the following systems:

sym. Dichlor ethylene:

+ unsym. Dichlor ethylene
+ Ethylene bromide
+ Ethylene chloride
+ 1.2 dibromo ethane
+ 1.2 dichloro ethane
+ 1.1.2.2 Tetra chloro ethane

Unsym. Dichlor ethylene

+ Ethylene bromide
+ Ethylene chloride
+ 1.2 dibromo ethane
+ 1.2 dichloro ethane
+ 1.1.2.2 tetra chloro ethane

TETRA CHLORO ETHANE \leq CHCl₂.CHCl₂.

100 gms. H₂O dissolve 0.288 gm. CHCl₂.CHCl₂ at 25° and 0.336 gm. at 55.6°. (Van Arkel and Vles, 1936.)

Freezing-points are given for mixtures of \leq tetra chloro ethane and each of the following compounds:

1.2 di bromo ethane (1)	penta chloro ethane (1)
1.2 di chloro ethane (1)	1.2 di cyan ethane (1)
cis. di chloro ethylene (2)	succinic acid (1)
trans " " (2)	p di chloro benzene (3)
tetra chloro ethylene (1)	naphthalene (4)
1.1.2 tri chloro ethane (1)	

(1) Timmermans and Mme. Vesselovsky, 1931; (2) Timmermans, 1927;

(3) Timmermans, 1934; (4) Cohen, de Meester and Moesfeld, 1925, 1930.

ACETYLENE TETRA BROMIDE CHBr₂.CHBr₂.

Freezing-point data are given by Timmermans and Mme. Vesselovsky, 1931, for:

ACETYLIDENE TETRA CHLORIDE $CH_2Cl CCl_3$.

SOLUBILITY OF ACETYLIDENE TETRA CHLORIDE IN WATER.
(Van Arkel and Vles, 1936.)

t°	Gms. $CH_2Cl CCl_3$ per 100 gms. H_2O	Gm. Mol. $CH_2Cl CCl_3$ per 100 gms. H_2O
0	0.120	0.00072
20	0.109	0.00065
35	0.115	0.00069
50	0.125	0.00074

DI IODO ETHYLENE $CHI:CHI$.

Freezing-point data for mixtures of Diiodo Ethylene and Dioxan are given by Rheinboldt and Luyken, 1932.

ACETYLENE DI IODIDE cis and trans $C_2H_2I_2$.

Results for the freezing-points of these two isomers are given by Chayanne and Vox, 1914.

KETENE CH_2CO .

Freezing-point data for mixtures of ketene and carbazol are given by Pascal, 1914.

TRI BROMO ACETAMIDE CBr_3CONH_2 .

Freezing-point data for mixtures of Tri bromo Acetamide and Tri chloro Acetamide are given by Küster, 1891.

DICHLORO ACETIC ACID $CHCl_2COOH$.

Results for the reciprocal solubility of dichloro acetic acid and water, determined by the freezing-point method are given by Pickering, 1895.

EQUILIBRIUM IN THE SYSTEM DICHLORO ACETIC ACID,

-13.2	16.3	-21.4	86.0
-13.2	51.3	-45.2	100.0

The critical solution temperature of the system Acetonitrile and 2,2,4 Tri methyl Pentane (i Octane) is 81° . That for the system acetonitrile and n Heptane is 84° . (Cornish, Archibald, Murphy and Evans, 1934.)

Freezing-point data are given by Joukovsky, 1934 for mixtures of Acetonitrile and each of the following compounds: Propionitrile, Butyronitrile, Valeronitrile, Benzene, Nitrobenzene and Formic Acid. This author also gives results for the total and partial vapor pressures of mixtures of acetonitrile and ether, and acetonitrile and methyl alcohol.

METHYL THIOCYANATE CH_3SCN .

Complete data for the T, r diagram of the pseudo binary system methyl thiocyanate (m. pt. $-53^\circ.58$) + methyl isothiocyanate (CH_3NCS) m. pt. $+35^\circ.93$ are given by Gillis, 1918. A single eutectic at -64.4° was found. The author also gives data for the curve of fusion of methyl iso thiocyanate + trimethyl tri thiocyanate (CH_3SCN)₃. A single eutectic at 34.9° was found. The boiling-point curve for $CH_3SCN + CH_3NCS$ is also given.

BROMAL HYDRATE $CB_3CH(OH)_2$

EQUILIBRIUM IN THE SYSTEM BROMAL-WATER. (Efremov, 1918.)

The sealed tube method was used. The tubes were constantly shaken and the rate of change of temperature during the observation of the disappearance of the last crystal was not more than 0.1 to 0.2 per hour. The temperature of the separation of the liquid into two layers was very sharp and the interval between separation and unification was only 0.2° .

The original results were plotted and the following values read from the curves.

t° of Cryst- allization or melting.	t° of separation into 2 layers.	Gms. CB_3CH per 100 gms. sat. sol.	Solid Phase.	t° of Cryst- allization or melting.	t° of separation into 2 layers.	Gms. CB_3CH per 100 gms. sat. sol.	Solid Phase.
— 1.0	—	2.5	Ice	40.0	107.2	76.0	$CB_3CH(OH)_2$
— 1.5	—	5.0	"	45.0	107.6	85.0	"
— 2.0	—	7.0	"	47.0	106.8	88.2	"
— 2.6 (Eutec.)	—	11.3	" + $CB_3CH(OH)_2$	48.0	106.5	90.0	"
— 1.5	—	12.5	$CB_3CH(OH)_2$	49.0	106.0	92.0	"

35.0	108.2	67.5	"	20.0	57.0	99.2	"

The author also gives data for the density and viscosity of mixtures of bromal and water at different temperatures.

The distribution coefficient of bromal hydrate between olive oil and water is 0.665 at ord. temp. (Baum, 1899); 0.7 at ord. temp. (Meyer, 1909).

CHLORO ACETIC ACID**SOLUBILITY OF THE α , β , AND γ MODIFICATION OF MONOCHLOROACETIC ACID
IN WATER AT DIFFERENT TEMPERATURES.**

(Miers and Isaac, 1908; Pickering, 1895.)

The determinations were made by the sealed tube method. The following figures were obtained by plotting the original results on cross-section paper:

Gms. per 100 Gms. of Each Sat. Solution.			t° .	Gms. per 100 Gms. of Each Sat. Solution.		
α Modifi- cation.	β Modifi- cation.	γ Modifi- cation.		α Modifi- cation.	β Modifi- cation.	γ Modifi- cation.

For β and γ see Ethane, p. 126

The solubility of Ethylene in Water at 25° in terms of the Bunsen Absorption Coefficient, β, was found by Orcutt and SeEVERS, 1936, to be 0.108. The authors made use of a modification of the Van Slyke-Neill, 1924, manometric apparatus which is based upon the principle of extracting the gas from the saturated solution and measuring its pressure. By means of a special technique and method of calculating the correction for unextracted gas, this becomes a simple method of determining the solubility of any gas in any liquid without the aid of previously determined constants.

100 cc H₂O dissolve 11.6 cc C₂H₄ (reduced to 0° and 760 mm.) at 21°.
(Venable and Fuwa, 1922.)

**SOLUBILITY OF ETHYLENE IN WATER, PLASMA, BLOOD AND

"	45	2.586	2.219	Limonene	22	no constant equilibrium	

Abs. Coef. A = vol. of ethylene absorbed by unit vol. of solvent at temp. stated.

For definition of Bunsen Coef. β, see §37.

The Coef. of Abs. β of ethylene in Russian petroleum is 0.164 at 10° and 0.142 at 20°. (Gniewosz and Walisz, 1887.)

1.0 cc. of absolute ethyl alcohol dissolves at t° (pressure not stated) 3.59498 —
0.057716 t + 0.0006812 t² cc. of ethylene. (Spörry, 1922, 1926.)

100 cc. of rubber dissolve 144.0 cc. (reduced to 0° of 760 mm.) ethylene at 21°. (Venable and Fuwa, 1922.)

The solubility of Ethylene in cyclohexanol is 0.299 at 26° in terms of the Ostwald Solubility Expression. (Cauquil, 1927.)

SOLUBILITY OF ETHYLENE IN SEVERAL SOLVENTS AT VARIOUS TEMPERATURES.

The data in the above table were obtained by plotting the results of Pickering (1893), Roloff (1895), Dahms (1896) (1899), de Coppet (1899), Kremann (1907), Faucon (1910), Balló (1910), Groschuff (1911), Paterno and Salimei (1913), and Tsakalotos (1914), on cross-section paper and drawing a curve through the points in best agreement. In addition to making determinations of the freezing-points of the mixtures, Balló also analyzed the solid phases which separated, and showed that these contained, in all cases, increasing percentages of acid and, therefore, must have consisted of mixed crystals. This formation of mixed crystals is offered as an explanation of the abnormality of the freezing-point lowering of the system.

SOLUBILITY OF ACETIC ACID IN ETHYL ALCOHOL (98.9%) DETERMINED BY

ACETIC ACID CH_3COOH .

SOLUBILITY IN AQUEOUS SOLUTIONS OF EPICHLORHYDRINE, (Leone and Benelli, 1922.)

The authors give data for the system $H_2O + CH_3COOH + CH_2ClCH_2Cl$. As a part of this study they determined the temperature of clearing and of clouding when weighed amounts of acetic acid were added to aqueous solutions of epichlorhydrine of definite weight per cent concentrations. These results when plotted on cross-section paper yield straight lines from which the following figures were read. At temperatures above 80° the epichlorhydrine begins to react with the water.

t°.	Gms. CH_3COOH per 100 gms. saturated solution in aqueous:

SOLUBILITY OF EPICHLORHYDRIN IN AQUEOUS SOLUTIONS OF ACETIC ACID.

(Leone and Benelli, 1922.)

Weighed amounts of aqueous acetic acid solutions of three concentrations were mixed with weighed amounts of epichlorhydrin and the temperatures of clearing and clouding determined. The results are all expressed in weight per cent. On account of reaction of the constituents, determinations could not be made above 80°. The authors' results were plotted and the following values for regular intervals of temperature were read from the curves. At each temperature there are two concentrations of epichlorhydrin at which saturation occurs. One represents the epichlorhydrin rich layer and the other the epichlorhydrin poor layer.

ISOTHERMS FOR THE SYSTEM EPICHLORHYDRIN, ACETIC ACID AND WATER
AT 0°, 10°, 40° AND 60°.

(Leone and Benelli, 1922.)

The authors' determinations were plotted on cross section paper and from the four curves the following values for regular intervals of concentration of acetic acid were read. At each concentration of acetic acid there are two concentrations of epichlorhydrin at which saturation occurs. There is a maximum for each curve which corresponds to the concentration of acetic acid above which the three constituents mix in all proportions. The results show for both acetic acid and epichlorhydrin the grams of each per 100 gms. of homogeneous mixture of the two with water.

ACETIC ACID

EQUILIBRIUM IN THE SYSTEM ACETIC ACID, ANILINE AND WATER.

(Angelescu and Motzoc, 1925.)

The determinations were made by titration with the aid of weight pipets, mixtures of two of the components with the third just to the appearance or disappearance of clouding. In order to locate the tie lines of the binodal curve determined by titration, the distribution of acetic acid between the aqueous and aniline layers was also determined.

4.65	2.56	1.82	9.63	7.25	1.33
			11.19	9.30	1.20

The authors also studied the equilibrium in this system as influenced by temperature. For this there was used, on the one hand a mixture of aniline and acetic acid of given concentration and on the other a mixture of water and acetic acid of the same concentration of acetic acid. Mixtures of these in any proportion give a ternary mixture of constant acetic acid concentration. Such ternary mixtures containing respectively 15.83, 16.56 percent CH_3COOH were each found to have an upper and a lower critical solution temperature and thus yield a closed solubility curve. The explanation of this was considered to be the hydrolysis of the aniline acetate

The following additional determinations of the system Acetic Acid, Aniline and Water at 0° are given by Ust-Kachkintsev and Nertshin, 1936.

Gms. per 100 gms. sat. solution		
$C_6H_5NH_2$	CH_3COOH	H_2O

NOTE.—The distribution results of Herz and co-workers are reported in millimoles per 10 cc. portions of each layer in the several cases. To obtain the figures given in the tables here shown, the original results, before and after calculating to gram quantities, were plotted on cross-section paper, and from the curves thus obtained, readings for regular intervals of concentration of acetic acid in the aqueous layer were selected.

DISTRIBUTION OF ACETIC ACID BETWEEN WATER AND BENZENE.

(Waddell, 1898; see also Lincoln, 1904.)

The measurements were made by adding varying amounts of benzene or water to 5 cc. of acetic acid and then running in water or benzene till saturation was reached. The observed readings were calculated to grams per 100 grams of the liquid mixture.

Additional data in connection with the distribution of acetic acid between water and benzene are given by King and Narracutt (1909), Kuriloff (1898), Farmer (1903), Bubanovic (1913), and Lincoln (1904). This latter investigator points out that the same degree of clouding does not represent the end point in all cases as was assumed by Waddell (1900).

Data for the distribution of acetic acid between benzene and aqueous solutions of sodium acetate at 25° are given by Farmer (1903).

ACETIC ACID

DISTRIBUTION OF ACETIC ACID BETWEEN THE CONJUGATE
LAYERS FORMED WITH WATER AND BENZENE AT 25°.

(Hand, 1930.)

The binodal curve was determined by titrating mixtures of two of the liquids with the third to an end point which was the mean of the amount which was unmistakably insufficient to produce clouding and that which was definitely in excess. The tie lines were determined by mixing sufficient quantities of the three liquids to yield two layers, and after attainment of equilibrium at 25°, about 2 gram quantities of each layer were removed, weighed and titrated for acetic acid with standard barium hydroxide.

Data showing the solubility of water in benzene as influenced by the presence of acetic and other fatty acids are given by Briegleb, 1930.

DISTRIBUTION OF ACETIC ACID BETWEEN WATER AND ETHYLETHER.

(Lofman, 1919.)

The author points out the discrepancies in previous determinations. In his experiments equal volumes of the two liquids were shaken together for one-half hour at constant temperature and each layer analyzed by titration, using phenolphthalein as indicator. Acetic acid forms double molecules in ether.

According to results obtained at 25° by Morgan and Benson (1907), the ratio of distribution for concentrations of acetic acid up to 12 grams per 100 cc. of the H₂O layer is more nearly constant (1.92) than shown above for 18°. A similar constancy of distribution (approx. 2.08 at 15°) was also found by Pinnow (1915).

Results showing the influence of varying concentrations of a large number of electrolytes upon the distribution of acetic acid between water and ether are given by de Kolomoosky, Dubinsky (1912), and by Hantzsch and Vagt (1901).

Data for the distribution of acetic acid between ether and molten CaCl₂·6H₂O and ether and molten LiNO₃·3H₂O are given by Morgan and Benson (1907).

The determination of the distribution of acetic acid between sat. aq. CaCl₂ solution (20 gms. per l.) and ketone gave 97.7 gms. and per 100 gms. aq. layer and 27 gms. per 100 gms. ketone layer at ordinary temperature. (Crowell, 1918.)

DISTRIBUTION OF ACETIC ACID BETWEEN WATER AND TOLUENE AT 25°.
(Woodman, 1926.)

Mixtures of weighed amounts of water and toluene were titrated with glacial acetic acid until only a slight turbidity remained after shaking. The mixture was then placed in a thermostat and the titration continued to homogeneity.

Iso Propyl Ether = $(CH_3)_2CHOCH(CH_3)_2$.

A method for the determination of the composition of mixtures of fatty acids, based upon their relative distribution between water and iso propyl ether is described by Werkman, 1930. A table of results for the distribution constants of mixtures of varying proportions of pairs of formic, acetic, propionic, butyric and lactic acids between water and iso propyl ether at 25° is given.

RECIPROCAL SOLUBILITY OF ACETIC ACID AND ANILINE.
(O' Connor, 1921.)

The freezing-point method could not be used in all cases and saturated solutions in contact with large amounts of solid at definite temperatures were prepared. These were analyzed by titrating the acetic acid in weighed portions and calculating the aniline by difference. The determinations were plotted and the following results read from the curve.

t°	Mols. CH_3COOH per 100 mols. sat. sol.	Solid Phase.	t°	Mols. CH_3COOH per 100 mols. sat. sol.	Solid Phase.

SOLUBILITY OF ACETIC ACID IN CARBON DISULFIDE, CYCLOHEXANE AND IN PETROLEUM, (Jones, 1923.)

The synthetic method was used and attention was directed particularly to the region of the critical solution temperature. The author was interested in the effect of small amounts of water upon the critical solution temperature and the use of this data as a criterion of purity of acetic acid. In addition to the results for pure acetic acid he gives data for the change in C. S. T. caused in each case by increasing amounts of water.

The distribution coefficient, defined as the milligrams of C₂H₅I per liter of blood divided by the mgs. per liter of the saturating gas mixture, composed of approximately 40 mgs. C₂H₅I per liter of air, was found to be 6.7 at 37°, for the bloods of 15 normal individuals. A correlation of this value and the number of red blood cells and the percentage of haemoglobin was made.

Freezing-point data for mixtures of Ethyl Iodide and Ethyl Ether are given by Wroczynski and Guye, 1910.

ETHYL HYPOCHLORITE C₂H₅OCl**DISTRIBUTION OF ETHYL HYPOCHLORITE BETWEEN WATER AND CARBON TETRACHLORIDE.**

(Taylor, Mac Mullin and Gammal, 1925.)

Carbon tetrachloride containing ethyl hypochlorite was stirred with an equal volume of water untill equilibrium was reached, and samples of each layer were withdrawn and analyzed for available chlorine.

GLYCINE (Glycocol) CH₂NH₂COOH.

SOLUBILITY OF GLYCINE IN WATER.

(Dalton and Schmidt, 1933.)

The following values are those derived from a solubility equation based upon the results of thirty very careful solubility determinations made at ten temperatures between 0° and 60°. Previous determinations by Dehn, 1917; Pfeiffer and Wüngler, 1916; Pfeiffer and Angern, 1924; Cohn, 1932, Sano, 1926a and Ando, 1926, differ more or less from the present results. The authors also give density determinations at 25° of aqueous glycine solutions varying in concentration from 9.2 to 20.4 percent CH₂NH₂COOH. The following results shown in parentheses are by Dunn, Ross and Reed, 1933. The density of the saturated solution at 25° is given as 1.0831 by McMeekin, Cohn and Weare, 1936.

GLYCINE

SOLUBILITY OF GLYCINE IN WATER AND IN AQUEOUS SOLUTIONS OF SALTS AT 20°.
(Pfeiffner and Würgler, 1916.)

Solutions of the neutral salts of known content were shaken with glycine two days at 20°. This period was sufficient for complete saturation. The glycine present in the saturated solution was determined by the Sørensen titration method. Tests showed that the salts present did not interfere with the accuracy of the method. For the solutions in which large quantities of glycine dissolved, a correction of the concentration of the salt resulting from the expansion of the solution, was applied. This was 0.58 cc. for each gram of glycol in 2 cc. of the sat. solution made with salt solution containing m mols of salt per 10 cc. The correction

ormula is $x = m \left(\frac{2 - n \cdot 0.58}{2} \right)$ in which n is the grams of glycol per 2 cc.

(1) In this case solid CH_2NH_2COOH was present and these results correspond respectively to the solubility of glycine in water saturated with butyl alcohol and to the solubility in butyl alcohol saturated with water.

The solubility of butyl alcohol in water saturated with glycine at 25° was found to be 0.44 gm. mols. per liter.

SOLUBILITY OF GLYCINE IN SEVERAL SOLVENTS AT 25°.

(McMeekin, Cohn and Weare, 1938.)

Solvent	Formula	d. of sat. solution	Gm. Mols. CH_2NH_2COOH per liter sat. sol.
Water	H_2O	1.0831	2.886

β = Absorption coefficient, *i.e.*, the volume of gas (reduced to 0° and 760 mm.) absorbed by 1 volume of the liquid when the pressure of the gas itself without the tension of the liquid amounts to 760 mm.

β' = Solubility, *i.e.*, the volume of gas (reduced to 0° and 760 mm.) which is absorbed by one volume of the liquid when the barometer indicates 760 mm. pressure.

g = the weight of gas in grams which is taken up by 100 grams of the pure solvent at the indicated temperature and a total pressure (that is, the partial pressure of the gas plus the vapor pressure of the liquid at the absorption temperature) of 760 mm.

Freezing-point data for mixtures of ethane and hydrochloric acid are given by Baume and Georgitses, 1912, 1914.

SOLUBILITY OF ETHANE IN SEVERAL ALCOHOLS
AND OTHER SOLVENTS.

ETHYL ALCOHOL C₂H₅OH

THE FREEZING-POINTS OF MIXTURES OF DENATURATED ALCOHOL AND WATER.

(Davis and Harvey, 1919).

The denaturated alcohol was composed of 100 parts of ethyl alcohol ($d_{20} = 0.811$) 10 parts of methyl alcohol ($d_{20} = 0.817$) and 0.5 part benzolene ($d_{20} = 0.800$, b. pt. 150°-265°). The freezing temperatures were measured by a nickel resistance thermometer. The resistance was read at intervals at a slowly increasing temperature and the break in the curve was taken to indicate the point of change from solid to liquid phase, that is, the melting-point.

The data for the binodal curve given by Corliss and by Bonner agree closely. The Sp. Gr. determinations of Corliss were made on larger amounts of solution and appear to be the more accurate. In addition, Corliss gives the specific gravities of each layer of a series of liquids in contact with each other, and from these and the binodal curve, the above data for the composition of the several conjugate layers have been calculated. Data are also given by Corliss for the distribution of colloidal arsenious sulfide between the two layers of the system.

Data for the distribution of ethyl alcohol between ether and water and between ether and molten $CaCl_2.6H_2O$ are given by Morgan and Benson (1907).

The binodal curve was determined in the usual way (see Note, p. 4). A series of conjugate liquids was then prepared and the Sp. Gr., refractive index and viscosity of each layer determined. From specially prepared curves for variations of physical constants with composition of mixture, the composition of the several conjugate liquids was ascertained. The results thus obtained, are given in the above table.

Data for the miscibility of ethyl alcohol with mixtures of water, ethyl ether and sulfuric acid at 0° and with mixtures of ethyl ether, water and ethylsulfuric acid at 0° are given by Kremann, 1910a.

MISCIBILITY OF ETHYL ALCOHOL (see Note p. 4) AT 0° WITH MIXTURES OF: Ethyl Acetate and Water. (Bonner, 1910.) Ethyl Bromide and Water. (Bonner, 1910.)

ETHYL ALCOHOL

EQUILIBRIUM IN THE SYSTEM ETHYL ALCOHOL, ETHYL ETHER AND WATER.
(Leland, 1934.)

The following results are given for the freezing-points of:

$C_2H_5OH + (C_2H_5)_2O$				$(C_2H_5)_2O + H_2O$			
t°	Wt. % C_2H_5OH	t°	Wt. % C_2H_5OH	t°	Wt. % C_2H_5OH	t°	Wt. % C_2H_5OH
-116.3	0.0	-123.0	49.2	-0.24	1.0	-2.20	8.10
-117.3	4.0	-125.0 Eutec	57.8	-0.50	2.07	-2.40	8.75
-117.7	7.4	-123.4	64.5	-0.78	3.05	-2.62	10.08
-118.3	13.5	-121.5	72.0	-1.00	3.80	-3.22	11.50
-119.2	22.1	-119.2	80.2	-1.29	5.0	-3.38	11.95
-120.0	31.3	-117.8	87.1	-1.54	5.92	-3.45	12.03
-121.3	39.2	-114.5	100.0	-1.79	6.79	-3.78 tr. pt.	12.85

The author then gives the freezing-points of a series of mixtures of $C_2H_5OH + H_2O$ to which increasing amounts of $(C_2H_5)_2O$ were added and obtains the following values for the line of the quadruple points.

t°	Gms. per 100 gms. Mixture		t°	Gms. per 100 gms. Mixture	
	C_2H_5OH	$(C_2H_5)_2O$		C_2H_5OH	$(C_2H_5)_2O$
- 3.78	0.0	12.8	-21.65	27.4	33.8
- 5.95	4.0	12.6	-21.56	26.95	45.65
- 8.4	7.8	12.3	-20.63	22.2	63.23
-12.86	14.2	12.2	-16.5	9.8	85.6
-17.95	20.8	14.2	- 8.0	1.7	96.8
-21.5	27.1	23.5	- 3.7	0.0	99.1

The author also gives results for the densities at 0° of binary and ternary mixtures of C_2H_5OH , $(C_2H_5)_2O$ and H_2O , which together with chemical determinations of $(C_2H_5)_2O$ serve for the analysis of ternary mixtures.

ETHYL ALCOHOL

EQUILIBRIUM IN THE SYSTEM ETHYL ALCOHOL, ETHYL ACETATE AND WATER. (Beech and Glasstone, 1936.)

The solubility (binodal) curve was determined by the titration method. The compositions of conjugate layers were determined by preparing mixtures of known amounts of the three constituents and analyzing the upper layer for acetate. These results and the solubility curve fix the tie lines. The points of intersection of the tie lines with the binodal curve correspond to the solutions in contact with each other.

RECIPROCAL SOLUBILITY OF ETHYL ALCOHOL AND NITROGLYCEROL. (Copeman, 1936.)

The determinations were made by the titration method using Ethyl Alcohol of $d_{15} = 0.812 = 93.9$ wt. % C₂H₅OH and filtered and dried Nitroglycerol of $d_{25} = 1.591$, determined by hydrometer. In the case of the solubility of alcohol in nitroglycerol the end point was that at which a faint permanent opalescence remained after long shaking. In the reverse case the end point was that at which the mixture just became clear on shaking.

t°	Solubility in terms of Wt. Percent of:		t°	Solubility in terms of Wt. Percent of:	
	Alcohol in Nitroglycerol	Nitroglycerol in Alcohol		Alcohol in Nitroglycerol	Nitroglycerol in Alcohol

EQUILIBRIUM IN THE SYSTEM NORMAL BUTYL ALCOHOL, ETHYL ALCOHOL AND WATER. (Drouillon, 1925.)

The synthetic method was used. Known mixtures were heated in sealed tubes to complete solution of the three constituents and then cooled slowly, while being shaken, until clouding appeared. A series of aqueous-ethyl alcohol mixtures were prepared and to each of these, increasing amounts of normal butyl alcohol were added and the temperatures of complete solution determined. The results were plotted and the following values for the isothermal curves were obtained.

Gms. C_4H_9OH per 100 gms. $H_2O + C_2H_5OH$ mixture.	Gms. $CH_3(CH_2)_3CH_2OH$ per 100 gms. sat. sol. at

EQUILIBRIUM IN THE SYSTEM ETHYL ALCOHOL, BENZENE AND WATER AT 25°.

(Washburn, Hnizda and Vold, 1931.)

The binodal curve was determined by titrating mixtures of ethyl alcohol and benzene with water to permanent cloudiness. The refractive indices of the saturated solutions were also determined as well as of separately prepared conjugate layers. From these results tie lines were located.

EQUILIBRIUM IN THE SYSTEM BENZENE, ETHYL ALCOHOL AND WATER. (Sidgwick and Spurloll, 1929.)

Benzene was added to known mixtures of alcohol and water untill two layers appeared or benzene crystallized out. For the two liquid equilibrium, the point was taken at which, on slow cooling, sufficient turbidity was produced to obscure a bright object placed behind the liquid. The extensive series of results were plotted on cross section paper and from the curves the following values for definite temperatures were interpolated.

Wt per cent C_2H_6 which yielded a second liquid layer (or crystallized benzene) when added to a mixture of $C_2H_5OH + H_2O$ containing.

EQUILIBRIUM IN THE SYSTEM BENZENE, ETHYL ALCOHOL AND WATER AT 15°,
25° AND 30°. (Ormandy and Craven, 1921.)

The benzene is given in per cent by weight in the mixture and the alcohol in weight percent. The results therefore, show, for the points of clouding, the per cent by weight of benzene present in a mixture composed of benzene and aqueous alcohol of the particular weight per cent shown.

Results at 15°.

The results at 15° were read from the curve plotted from 30 determinations. They agree quite closely with similar determinations reported by Sidgwick and Spurrell, 1920; Taylor, 1897; and Bonner, 1910.

SOLUBILITY OF BENZENE IN DILUTE SOLUTIONS OF ETHYL ALCOHOL. (Ormandy and Craven, 1922.)

A mechanical stirrer was used. Readings were taken at the point where turbidity was distinctly visible and at the point where the liquid became quite clear. The mean of these was taken as the true equilibrium point. The results, were plotted and the following table constructed from the curves.

Strength of Alcohol in wt. %.	Results for Benzene at			Results for Petrol A. at 15°.	Results for Petrol + benzene (1:1) at 15°.
	0°.	15°.	30°.		
0.....	0.08	0.15	—	0.004	—

45.....	1.80	3.00	—	0.20	0.45
50.....	—	—	—	0.42	—

The figures show the percent by weight of benzene and petrol in the final equilibrium mixtures. It is evident from the results that benzene can be effectively removed from alcohol by dilution and extraction with petrol, hence, it is a rather poor denaturant for alcohol.

Data for equilibrium at — 15°, 0°, 15° and 30° in a system composed of 3 volumes of benzene + 1 volume of toluene (instead of benzene alone), alcohol and water, are given by Ormandy and Craven, 1921.

EQUILIBRIUM IN THE SYSTEM ETHYL ALCOHOL, TOLUENE AND WATER AT 25°.

(Washburn, Begun and Beckord, 1939.)

The binodal curve was determined by the titration method. The refractive indices of the homogeneous solutions were determined as well as those of the layers formed by mixing appropriate amounts of the liquids and from these results the tie lines were located.

RECIPROCAL SOLUBILITY OF ETHYL ALCOHOL, HEXANE AND WATER AT -30°
AND $+30^\circ$. (Ormandy and Craven, 1922.)

Three samples of hexane, obtained from different sources, were used. These had densities and boiling-points which differed from published data, and were, therefore, of unknown purity. Reciprocal solubility determinations were made as described under heptane (following page). The original determinations of the authors, when plotted on cross section paper, give average curves from which the following values were read.

Wt. % C_2H_5OH in aq. Alcohol Mixture used.	Gms. Hexane per 100 gms. sat. sol. at		Wt. % C_2H_5OH in aq. Alcohol Mixture used.	Gms. Hexane per 100 gms. sat. sol. at

* Kahlbaum's Heptane and Hexane "aus Petroleum" were used.

RECIPROCAL SOLUBILITY OF ETHYL ALCOHOL, HEPTANE AND WATER.
(Ormandy and Craven, 1922.)

The heptane was purified by acid washing and fractionation. The $d_{15}^{20} = 0.6887$ and the b. pt. was 98° 3-98° 4 (760 mm.). The aniline point was 71°. The determinations were made by adding to a given volume of the hydrocarbon a mixture of alcohol and water until clouding appeared. Two concentrations of alcohol contained in two pipets were used and the clouding produced and discharged alternately. The weights of each constituent were calculated from the specific gravity of each and the results reported on the weight per cent basis.

EQUILIBRIUM IN THE SYSTEM ETHYL ALCOHOL, CYCLOHEXANE AND WATER AT 25°.
(Vold and Washburn, 1932.)

The binodal curve was determined by the titration method. The refractive indices of these and of the two layers obtained with appropriate amounts of the three liquids gave results from which the distribution of alcohol between water and cyclohexane was calculated. Results for the freezing-points of mixtures of ethyl alcohol and cyclohexane are also given.

Data for the reciprocal solubility of ethyl alcohol and turpentine are given by Vèzes and Mouline, 1904, 1905-06.

Data for the system ethyl alcohol, water, petroleum are given by Rodt (1916).

RECIPROCAL SOLUBILITY OF ETHYL ALCOHOL, GASOLINE AND WATER AT 5° AND AT 20°.

(Gay and Massol, 1925; Perrakis and Massol, 1924.)

A titration method was used. Various weighed mixtures of alcohol and gasoline were titrated with water to appearance of clouding. Above 75 per cent of alcohol it was necessary to titrate mixtures of alcohol and water with gasoline. The composition of the mixture was determined in all cases by weighing. The gasoline had a d_{20}^4 of 0.747. On distilling 200 cc. the first 10 cc. came over at 60-69° and the last 10 cc. at 215-236°. A diagram of the distillation curve shows a somewhat wavy line between these temperatures.

The authors also discuss the effect of salts upon the dehydration of alcohol. It was shown that ammonium sulfate and hyposulfite are poor dehydrating agents and potassium fluoride and carbonate are good dehydrating agents. They give results showing the composition of the upper layers in contact with sat. solutions of K₂CO₃. Much more complete data for the system alcohol + gasoline + water + K₂CO₃ at 20° are given by Gay, Mion and Servigne, 1924. These authors give numerical data and diagrams for the composition of each of the three layers which separate in this system.

RECIPROCAL SOLUBILITY OF ETHYL ALCOHOL, GASOLINE AND WATER.
(Bridgeman and Querfeld, 1933.)

The temperatures were determined at which a second phase separated on slowly cooling accurately prepared mixtures of gasoline (from different sources) and ethyl alcohol containing from 1 to 8 volume percent H_2O . Of the various gasoline samples the following two tables contain respectively the results for the one having the highest and the lowest critical solution temperatures.

Results for sample No. 1.

The authors also present data showing the relation between volatility of a gasoline and its miscibility with ethyl alcohol containing water. The more volatile samples were found to be more miscible in that they gave mixtures having lower critical solution temperatures than similar mixtures with less volatile gasoline. Straight run gasolines of equal volatility show little difference in their miscibility temperatures with ethyl alcohol-water mixtures. Cracked gasolines may, however, show much lower critical solution temperatures than straight run products of the same volatility.

RECIPROCAL SOLUBILITY OF ETHYL ALCOHOL AND GASOLINE IN PRESENCE OF A THIRD SOLVENT. (Rothen and Boutier, 1923.)

The alcohol had $d_{15} = 0.812$. The gasoline was an American product of $d_{15} = 0.723$. The titration method was employed. The figures in the table below show the cubic centimeters of the third solvent (A) which must be added to 100 cc. of the following volume per cent mixtures of alcohol and gasoline to obtain a homogeneous solution at 0° and 15°.

* Indicates that a homogeneous mixture could not be obtained.

The authors also give diagrams showing the amounts of the third solvent required at temperatures from about -20 to +20°.

It is pointed out by Boutaric and Corbet, 1927, that in cases where the determination of the end point of limiting miscibility is rendered difficult by nearness of the refractive indices of the liquids or when the critical solution temperature is very low, the presence of a third solvent may overcome these difficulties. Illustrative results are given for the system CH₃OH + benzene to which different amounts of oil of colozza were added and for the systems C₂H₅OH + benzene and C₂H₅OH + several gasolines to which definite percentages of H₂O were added.

MUTUAL MISCIBILITY TEMPERATURE OF A MIXTURE OF ETHYL ALCOHOL AND PARAFFINE. (Howard and Patterson, 1926.)

To a mixture of equal weights of absolute C₂H₅OH and paraffine (b. pt. 168-180°), which had a mutual miscibility temperature of 19°9, increasing amounts of a large number of salts were added and the elevation of the mutual miscibility temperature determined. Results showing the effect of increasing amounts of water upon the mutual miscibility temperature are also given. The critical solution temperature of ethyl alcohol and paraffine was found to be at 33°5 and at 13 per cent C₂H₅OH.

EQUILIBRIUM IN THE SYSTEM ETHYL ALCOHOL, ETHYL ETHER AND WATER.
(Laland, 1932, 1933, 1934a.)

The binodal curve was located by titrating a carefully made mixture of $C_2H_5OH + (C_2H_5)_2O$ with H_2O . The points on the binodal curve which correspond to conjugate layers, were found by preparing mixtures which yield two layers and analytically determining the ether content of each of these.

**EQUILIBRIUM IN TERNARY SYSTEMS COMPOSED OF GLYCOL
ACETONE AND ANOTHER COMPOUND.**

(Trimble and Fraser, 1929.)

The determinations of the binodal curves were made by titrating to the appearance or disappearance of clouding. Since glycol cannot be satisfactorily measured in ordinary volumetric apparatus it was weighed out from a dropping bottle of the ground-in pipet type and the volume calculated from the $d = 1.1131$ at 20° . Tie lines were determined by the method of Miller and McPherson, 1908. This method rests upon the principle that the distance from the point representing the gross composition of a mixture yielding two immiscible layers, to the ends of the tie lines through this point are inversely proportional to the volumes of the phases into which the mixture separates.

0.186	0.999	0.533	0.470
0.314	0.818	4.06	0.242

By extrapolation the solubility of pure ethyl hydrogen sulfate in pure ether should be about 1.27 gms. $C_2H_5HSO_4$ per 100 gms. dry ether at 30°.

DI METHYL AMINE (CH₃)₂NH.

The solubility of dimethyl amine in water at 60°, calculated from the vapor pressures determined by an aspiration method was found by Doyer, 1890, to be 188 in terms of the Bunsen Absorption Coefficient and 230 in terms of the Ostwald Solubility Expression, γ , at vapor pressure of 90.3 mm Hg.

Freezing-point data for mixtures of dimethyl amine and water are given by Pickering, 1893.

ACROLEIN $CH_2 : CH.CH.O$.**RECIPROCAL SOLUBILITY OF ACROLEIN AND WATER.**

(Boutaric, 1920; Boutaric and Corbet, 1926.)

The temperatures of clouding and of clearing in mixtures of weighed amounts of acrolein and water were determined. Sealed tubes were used at the higher temperatures. The acrolein was stabilized by the addition of $\frac{1}{250}$ th of its weight of hydroquinol. The original determinations were plotted and the following results read from the curve. The authors also give a few results for the effect of different amounts of hydroquinol and of gallic acid upon the reciprocal solubilities. They found by extrapolation of the critical temperatures of acrolein stabilized with different amounts of hydroquinol, that the critical temperature of pure acrolein in water is $88^{\circ}.2$. Determinations are also given of the effect upon the critical temperature resulting from the presence of increasing amounts of soluble resin of acrolein.

Appreciable hydrolysis occurs at 100° .

SOLUBILITY OF TRINITROGLYCERIN AND OF DINITROGLYCERIN, IN
AQUEOUS SOLUTIONS OF NITRIC ACID AND OF SODIUM CARBONATE.
(Ohman, 1831.)

The results are given only in the form of diagrams from which the following values were taken. The temperature is not stated. The author also gives distribution and other results having reference to practical manufacturing conditions. The results show that losses in washing depend upon the content of dinitrolycerin in the trinitro-glycerin phase.

* Anethol = *p* Propenylanisol, CH₃.CH:CH.C₆H₄OCH₃.

† Naphthalene results at 35°.

NOTE. — In the case of the results for the aqueous solutions of electrolytes, the determinations were made by adding successive small quantities of acetone to the mixtures of given amounts of water and electrolyte, and noting the point at which a clouding, due to the separation of a second phase, occurred. In the case of the aqueous non-electrolyte solutions, successive small amounts of water were added to mixtures of known amounts of acetone and the non-electrolyte. In all cases the results, as given in the original papers, have been recalculated and plotted on cross-section paper. From the curves so obtained, the above table was constructed.

Additional data for systems containing acetone are given under the salt involved, as, for instance, Potassium Carbonate, Potassium Fluoride, etc. (see Vol. I.)

0.018	0.982	0.464	0.98	0.02	0.98	0.849	0.95

NOTE. — The determinations were made by gradually adding acetone to the mixtures of the given amounts of water and the other constituent until a homogeneous solution was obtained. The results give the binodal curve for the system. The author also determined "tie lines" showing the compositions of the various pairs of liquids which may exist in equilibrium. When the two layers are practically of the same composition the tie line is reduced to a point designated as the "plait point" of the binodal curve. This point is indicated by a * in the above tables.

SOLUBILITY OF ACETONE IN AQUEOUS SOLUTIONS OF CARBOHYDRATES.

The determinations were made as in the case of the solubility of acetone in aqueous solutions of electrolytes. See preceding page.

MISCIBILITY OF ACETONE, *n* BUTYLALCOHOL AND WATER AT 20°.
(Reilly and Ralph, 1919.)

Exceedingly great care was exercised in purifying the materials. The Acetone was of $d_{20}^4 = 0.79091$ and b. pt. 56°-56°5. The *n* Butylalcohol had $d_{20}^4 = 0.80953$ and b. pt. 117°6 at 760mm. The densities of a complete series of mixtures of weighed amounts of Acetone, *n* Butylalcohol and water were determined at d_{20}^4 and the results plotted. The miscibility limits for *n* Butylalcohol and water were determined by bringing mixtures of the two liquids to equilibrium in a thermostat at 20° and calculating the composition of each layer from its density. In order to determine the miscibility of the three components, acetone was added from a buret to a mixture of slightly more *n* Butylalcohol than required to saturate a given amount of water, until the cloudy mixture just became clear. From the increase in weight the relative amounts of *n* Butylalcohol, acetone and water were calculated. A series of these determinations located the boundary curve of the system.

Gms. per 100 gms. of mixture.			d_{20}^4
<i>n</i> Butylalcohol.	Acetone.	Water.	
7.90	92.10	0.9869
12.00	9.26	78.74	0.9670
18.64	11.62	69.74	0.9484
24.68	12.65	62.67	0.9340

The author also determined the composition of the homogeneous layers formed in the quadruple system; Acetone, Glycerol, Acetic Anhydride and Water at 20°.

EQUILIBRIUM IN THE SYSTEM ACETONE, NORMAL BUTYL
ALCOHOL AND WATER.
(Jones, 1929.)

Mixtures of *n* butyl alcohol and acetone were made up by weight and the solubility of each of these mixtures with water was determined by the synthetic method. These results were plotted and the isothermal (binodal) curves thus located. The author's curve for 20° agrees with the previous results of Reilly and Ralph, 1919. Results were also given showing the effect of impurities on the binary and ternary upper critical solution temperatures of the system.

EQUILIBRIUM IN THE SYSTEM ACETONE, FURFURAL AND WATER AT 25°.

(Lloyd, Thompson and Ferguson, 1937.)

The binodal curve was determined by titration, using a closed container provided with a side tube through which the liquids were introduced from a weight buret having a long fine delivery tip. Tie lines were determined by analysis for furfural of liquid layers prepared from weighed amounts of the constituents.

THE TERNARY SYSTEM ACETONE, TOLUENE AND WATER.

(Walton and Jenkins, 1923.)

Definite amounts of water and toluene were mechanically stirred at constant temperature and acetone slowly added until the mixture just cleared. The volumes of the liquids were read from burets. A series of such determinations gave the equilibrium line between the one-liquid phase and the two-liquid phase systems.

The distribution coefficient of acetone between olive oil and water is given by Meyer (1901), as 0.146 at 3° and 0.235 at 30°.

DISTRIBUTION OF ACETONE BETWEEN WATER AND CHLOROFORM AT 25°.
(Hand, 1930.)

Suitable quantities of the three liquids to yield two layers were mixed and brought to equilibrium at 25°. Samples of each layer were withdrawn with extreme care and analyzed for chloroform and acetone.

* See Note, page 106

Philip and Bramby also give data for the effect of NaCl, KCl and LiCl upon the distribution of acetone between benzene and water.

In the determinations by Hantzsch and Vagt the equilibrium was approached from above. The amount of acetone in the lower layer was determined by analysis, and that in the upper layer calculated by difference.

The authors also give results for a number of other aqueous salt solutions. It is concluded that the salting out effect depends upon the nature of the substances to be salted out and little upon the concentration and temperature. It is also dependant upon the nature of the salt and is roughly proportional to the concentration of the salt solution.

Additional data for this system are given by Tsakalatos (1914), Herz (1917) and Balló (1910). The last-named investigator also determined the composition of the solid phases and explains the abnormal freezing-point lowering on the basis of production of mix-crystals.

The ratio of distribution of propionic acid between water and benzene was found by King and Narracott (1909) to be 1:0.129 at room temperature.

PROPYL ACETATE, BROMIDE, CHLORIDE, etc.

SOLUBILITY OF EACH SEPARATELY IN WATER. (Fühner, 1924.)

The determinations were made simply by measuring from a buret the quantity of each compound just sufficient to saturate a given amount of water after thorough shaking. High accuracy is not claimed for the results.

Compound.	Formula.	t°.	Gms. compd. per 100 gms. sat. sol.

**SOLUBILITY OF *d* ALANINE AND OF *dl* ALANINE, EACH SEPARATELY, IN
WATER AT DIFFERENT TEMPERATURES.**

(Dalton and Schmidt, 1933.)

The following results were derived from equations based in each case upon 18 very careful solubility determinations at 9 different temperatures between 0 and 65°.

Results are also given for the densities at 25° of solutions of *d* Alanine varying from 0.89 to 14.38 percent and for *dl* Alanine varying from 1.1 to 15.0 percent. The following results in parentheses are those of Dunn, Ross and Read, 1933.

ALANINE (α Aminopropionic Acid) $CH_3CH(NH_2)COOH$.

Phenyl ALANINE (β Phenyl α Aminopropionic Acid) $C_6H_5CH_2CH(NH_2)COOH$.

**SOLUBILITY OF *d, l* ALANINE AND OF *d, l* PHENYLALANINE IN
WATER AND IN AQUEOUS SALT SOLUTIONS AT 21°.** (Pfeiffer and Angern, 1924.)

The saturated solutions in water were prepared by continuous agitation at constant temperature for 3 days. The filtered solution was analyzed by the Sørensen method of titration, in which formaldehyde is added and the resulting methylene aminoacid titrated with sodium hydroxide, using phenolphthalein as indicator. The solubility in salt solutions was determined by adding the amount of salt to 5.0 cc. of the saturated solution in water necessary to yield 0.02 molecular concentration, and continuing the agitation for another 3 days. The resulting precipitate of amino acid was filtered, dried at 120-130° and its weight (after correction for inorganic salts by ashing) subtracted from the aminoacid originally present in the water.

100 gms. sat. sol. in water contain 39.7 gms. of the compd. at 0° and 48.8 gms. at 20°.
(Nylen, 1926.)

dl **SERINE** CH₂OHCH(NH₂)COOH.

SOLUBILITY OF SERINE IN WATER.

(Dalton and Schmidt, 1935.)

The results of 32 determinations at temperatures between 0-62° were used for calculating the solubility equation and from this the following values for 5° intervals were obtained. The values above 70° are not considered as accurate as those for the lower temperatures. Density determinations of several dilute aqueous solutions at 25° are also given.

The temperatures given as the freezing-points were those at which crystals appeared and continued to grow. On account of the tendency of glycerol to supercool, seeding was required to obtain true freezing-points of all the more concentrated solutions, beginning at the eutectic point.

Data for this system are also given by Pushin and Glagoleva, 1922, but their results agree with those of Lane only in the region of the higher concentrations of glycerol. They report the eutectic at —31° and 20 mol. per cent (= 57.62 wt. per cent) glycerol, and their other points are evidently incorrect.

CRITICAL SOLUTION TEMPERATURES OF MIXTURES OF GLYCEROL AND OTHER SOLVENTS:

(Lecat, 1930.)

System	Critical Solution Temp.	Wt. Percent Glycerol in mixture
Glycerol + Ethyl phenyl acetate	81	7.0
" + Ethyl salicylate	> 226	10.0
" + Bornyl acetate	200	9.0
" + i Butyl benzoate	230	14.0
" + n " "	242	17.0
" + Eugenol	166	14.0
" + Methyl Salicylate	170	7.5
" + o Nitro toluene	193	8.0
" + p " "	220	17.0

100 gms. liquid Carbon Dioxide dissolve less than 0.05 gm. glycerol, Quinn, 1928.

Freezing-point data are given by Puschin and Dezelic, 1932, for mixtures of Glycerol and Oleic, Palmitic and Stearic Acids.

TRI METHYL AMINE (CH₃)₃N.

Freezing-point data for mixtures of tri methyl amine and water are given by Pickering, 1893.

SOLUBILITY OF TRIMETHYL AMINE IN VARIOUS SOLVENTS AT 25°.

(v. Halban, 1913.)

The measurements were made according to the dynamic method in the form developed by R. Abegg and his collaborators (Gaus, 1900; Abegg and Riesenfeld, 1902). The calculations of the partial pressures of the trimethylamine were made according to the Abegg and Riesenfeld method.

E = calc. partial pressure of $(CH_3)_3N$ above a 1 normal solution, based on Henry's Law.

λ = solubility, *i.e.*, the quotient of the concentration in the solution and in the gas phase: $\lambda = \frac{\text{mols. } (CH_3)_3N \text{ per liter} \times RT \times 760}{\text{partial pressure of } (CH_3)_3N \text{ in mm. Hg}}, RT \times 760 = 18,590.$

Solvent.	E .	λ .	Solvent.	E .	λ .	Solvent.	E .	λ .
Methyl Alc.	26.1	711	Acetophenone	321	57.9	Ethyl Acetate	220	84.5

The authors also give a series of determinations of the distribution of trimethyl amine between aqueous solutions of various salts and benzene at 25°. The results in general show that from an organic to an aqueous layer in presence of the salts, there is a marked salting out effect. Chlorides have the greatest effect, bromides next and iodides least.

MALEIC ANHYDRIDE C₄H₂O₃.

100 cc. xylene dissolve 16.32 gms. maleic anhydride at 29° 7.

100 cc. coal tar heavy solvent dissolve 9.04 gms. maleic anhydride at 29° 7.
(Weiss and Downs, 1923.)

MALEIC DIAMIDE C₄H₂O₂(NH₂).

100 cc. H₂O dissolve 0.248 gm. maleic diamide at 50°. (Viseur, 1926.)

Freezing-point data for mixtures of maleic anhydride and succinic anhydride are given by Grimm, Gunther and Titus, 1931.

ALLOXANE NHCONHCOCOCO.

100 cc H₂O dissolve about 0.08 gm. alloxane

10 cc cold sat. aq. solution of Mg(ClO₄)₂ dissolve about 0.3 gm. alloxane. (Duclaux and Durand-Gasselin, 1938.)

DICYANO ETHANE C₂H₄(CN)₂.

Freezing-point data for mixtures 1.1.2.2 dicyano ethane and each of the following compounds are given by Timmermans and Mme. Vesselovsky, 1931: Carbon tetrachloride, ethane tetra ethyl carboxylate, ethane tetra methyl carboxylate, ethyl succinate, methyl succinate 1.2 dichloro ethane and tetra chloroethane.

SUCCINIC NITRILE (Ethylene Cyanide) CNCH₂CH₂CN.

The solubility of succinic nitrile in water and also in aqueous sodium chloride solutions at various temperatures has been determined by Schreinemakers (1897), and the results presented in terms of mols. of nitrile per 100 mols. of nitrile + H₂O. The following calculations of these results to gram quantities was made by Rothmund.
(Landolt and Börnstein's, "Tabellen" 1906.)

t°.	Gms. CNCH ₂ CH ₂ CN per 100 Gms.		t°.	Gms. CNCH ₂ CH ₂ CN per 100 Gms.

THIOPHENE C_4H_4S .

Freezing-point data for mixtures of thiophene and benzene are given by Tsakalotos and Guye, 1910

FUMARIC ACID $COOH.CH:CHCOOH$.**MALEIC ACID** $COOH.CH:CHCOOH$.

SOLUBILITY OF EACH SEPARATELY IN WATER.
(Lange and Sinks, 1930.)

Determinations were made at approximately 5° intervals between 0° and 80° and curves plotted from the results. The following equations for the grams of acid per 100 grams sat. solution were calculated from the curves. Fumaric Acid, $\log C = 0.645t - 0.6362$ and Maleic Acid at 0° to 40° $C = 0.645t + 28.2$ and from 40° to 80° $C = 0.492t + 34.5$. Using the above equations the following values have been calculated.

t°	Gms. per 100 gms. sat. sol.		t°	Gms. per 100 gms. sat. sol.	
	Fumaric acid	Maleic acid		Fumaric acid	Maleic acid
0	0.231	28.2	40	1.077	54.1
10	0.330	34.6	50	1.584	59.1
20	0.499	41.1	60	2.328	64.0

ALLYL CYANIDE CH₂:CHCH₂CN.

Freezing-point data for mixtures of allyl cyanide and aniline are given by Lafortune, 1923.

CROTONIC ACID NITRILE CH₃CH:CHCN.

Freezing-point data for mixtures of Crotonic Acid nitrile and aniline are given by Lafortune, 1923.

ALLYL iso SULFOCYANIDE CH₂:CHCH₂NCS.

Freezing-point data are given by Joukovsky, 1934, for mixtures of allyl iso sulfocyanide with benzene, with nitrobenzene, and with formic acid. The author also gives results for the total and partial vapor pressures at 20.5° of allyl iso sulfocyanide and ethyl ether, methyl alcohol and carbon disulfide.

Freezing-point data for mixtures of Allyl iso sulfocyanide (Allyl mustard oil) and aniline are given by Kurnakov and Kviot, 1913; and Kurnakov and Solover, 1916.

SUCCINIMIDE $\begin{matrix} \text{CH}_2\text{CO} \\ \text{CH}_2\text{CO} \end{matrix} > \text{NH.H}_2\text{O}$.**SOLUBILITY OF SUCCINIMIDE HYDRATE IN WATER AND IN ETHYL ALCOHOL.**

Very careful determinations of this distribution at 0° and at 25°, in which the ionization of the succinic acid in the two solvents is taken into consideration, are given by Chandler, 1908. Two determinations at 0° and two at 15° are quoted by Kolossovsky, 1911. Earlier data for this system are given by Nernst, "Theoretical Chemistry," 3rd English edition, p. 496.

Data for the solubility of Succinic Acid in Acetone in presence of Maleic and of Fumaric Acids and vice versa at 20° are given by Viseur, 1926.

Diagrams showing the solubility of Succinic Acid in various binary mixtures of Water, Acetone, Carbon Tetrachloride, Methyl, Ethyl and Propyl Alcohols at 20° and at 40° are given by Bancroft and Butler, 1932.

Freezing-point data are given for mixtures of Succinic Acid and:

1,2 Dichlor ethane(4)	β Naphthol(1)	Pyrocatechol(1)
Di nitro phenol(1)	α Naphthylamine(2)	Pyrogallol(1)
Fumaric Acid(3)	β " (2)	Picric Acid

METHYL MALONIC ACID (Iso Succinic Acid) $CH(CH_3)(COOH)_2$.

100 gms. H_2O dissolve 123.8 gms. $CH(CH_3)(COOH)_2$ at 25°.
 " " C_6H_6 " 0.003 gm. " "

(Verkade and Coops, 1930a.)

The critical solution temperature of a mixture of methyl malonate and camphene is 74° and there is 44.6 percent methyl malonate present.

(Lecat, 1930.)

MALIC ACID (inactive) COOHCH(OH)CH₂COOH.

SOLUBILITY OF MALIC ACID IN WATER.

(Lange and Sinks, 1930.)

From the determinations at approximately 5° intervals a curve was plotted and from this the equation $C = 0.438t + 47.04$ was derived. The following results were calculated from the authors' equation.

t°	Gms. C ₄ H ₆ O ₅ per 100 gms. sat. sol.	t°	Gms. C ₄ H ₆ O ₅ per 100 gms. sat. sol.
0	47.04	40	64.6
10	51.42	50	68.9(68.95)
20	55.8	60	73.3(72.85)
25	58.0(59.15 at 26°)	70	77.7(76.85)
30	60.2	80	82.1(80.65 at 79°)

The authors also give results for the densities and refractive indices of aqueous solutions of malic acid.

The results in parentheses are by Weiss and Downs, 1923.

The solubility of laevo Malic Acid in Water is given by Timmermans and Dumont, 1931, as 26.96 gms. C₄H₆O₅ per 100 gms. H₂O at 10° and 36.35 gms. at 20°. The eutectic point is given as at -2.20° with 15.0 gms. l malic acid per 100 gms. H₂O.

ERYTHRITOL TETRA NITRATE i (Nitroerythrite) $(CHNO_3CH_2NO_3)_2$.

Freezing-point data for mixtures of Erythritol Tetranitrate and each of the following compounds: Nitromannite, nitro penta erythrite, nitro phenetol, p nitro toluene, 2.4.6 tri nitro toluene and m dinitro benzene are given by Urbanski, 1933, 1934.

BUTYRO NITRILE $CH_3(CH_2)_2CN$.

Freezing-point data are given by Joukovsky, 1934, for mixtures of Butyro nitrile with Acetonitrile, Proprio nitrile, Valeronitrile and with Benzene

BUTYL CHLORALDEHYDE $CH_2Cl(CH_2)_2CHO$.

Freezing-point data for mixtures of Butyl chloraldehyde and Pyramidon are given by Pfeiffer and Seydel, 1928.

BUTYL CHLORAL HYDRATE $CH_3CHClCCl_2CH(OH)_2$.

Freezing-point data for mixtures of Butyl chloral hydrate and Anti-pyrine are given by Pfeiffer and Seydel, 1929.

ChloroACETIC ACID ESTERS.

SOLUBILITY OF MONOCHLOR, DICHLOR, AND OF TRICHLORACETIC ESTER IN AQUEOUS ALCOHOL AT ROOM TEMPERATURE.

(Bancroft — Phys. Rev. 3, 193, 1895-96, from results of Pfeiffer, Z. physik. chem. 9, 460, '92.)

l and *dl* ASPARTIC ACIDS $HOOC \cdot C_2H_3(NH_2)COOH$.

SOLUBILITY OF *l* AND OF *dl* ASPARTIC ACID, EACH DETERMINED
SEPARATELY, IN WATER.

(Dalton and Schmidt, 1933.)

In the case of the *l* Aspartic Acid 38 determinations were made at 9 temperatures between 0° and 60° . In the case of the *dl* acid 30 determinations were made at 9 temperatures between 0° and 65° . From the solubility equations obtained from these results the following values for regular intervals of temperature were derived. The values above 65° are less accurate than those below. The density of approximately saturated solutions at 25° was very close to 1.00.

ββ' Dichlor ETHYL SULFIDE (= Mustard Gas =) S(CH₂.CH₂Cl)₂

SOLUBILITY OF "MUSTARD GAS" IN WATER.
(Boulin and Simon, 1920; Wilson, Fuller and Schur, 1922.)

B and S titrated the acidity of the aqueous solution immediately and after 24 hours and considered the results to show the amount of the compound which dissolved and afterwards decomposed. Approximate determinations in this manner, using cold water, gave 0.48 gm. S (CH₂.CH₂Cl)₂ per liter.

The rate of decomposition at temperatures of 20°, 50° and 100° was found to be approximately as 1 : 7.5 : 30. The effect of alkalis and of thiodiglycol on this decomposition was studied.

W, F and S shook "mustard gas" vigorously with water at 25° for 10 seconds and filtered the mixture during the next 20 seconds with the aid of suction. The result of several determinations was 0.0043 gm. mols or 0.684 gm. S (CH₂.CH₂Cl)₂ per liter at 25°.

THE MUTUAL SOLUBILITY OF « MUSTARD GAS » AND ETHYL ALCOHOL.
(Thompson, Black and Sohl, 1921.)

The synthetic method was used. The temperatures of complete solution and of clouding of known mixtures were determined.

Results with 92.5 % Alcohol.

Wt. % Ketone in Mixture	18.15	18.08	18	18.08	88.2	85.05

Data for the reciprocal solubility of ethyl methyl ketone and water, containing 1.5% ethyl alcohol, are given by Bruni (1899, 1900). This system is of interest particularly on account of having both an upper and a lower critical point.

Freezing-point data for mixtures of ethylmethyl ketone and water are given by Timmermans (1911) and by Bruni, 1899, 1900.

More recent determinations of the reciprocal solubility of Ethyl methyl ketone, (Butanone) and water are:

t°	Gms. $CH_3CO.C_2H_5$ per 100 gms. sat. solution in H_2O	Gms. H_2O per 100 gms. sat. solution in $CH_3CO.C_2H_5$	Authority
20	24.0	10.0	(Jones, 1929.)
25 (approx.)	22.6	9.9	(Park and Hofmann, 1832.)

Approximate determinations of the Solubility of Ethyl Methyl Ketone (Butanone) in aqueous solutions of metal perchlorates show that the volume of butanone dissolved per 10 cc of cold perchlorate solutions increases from about 5 cc to more than 10 cc as the concentrations of perchlorate increases from 0.1 to 0.3 normal. (Duclaux and Durand-

MUTUAL SOLUBILITY OF ETHYL METHYL KETONE AND GLYCEROL
(Mc Ewen, 1923.)

The synthetic method was used. The temperatures were determined at which liquid phases separated from mixtures of known composition.

SOLUBILITY OF ETHYL ACETATE IN WATER. (Glasstone and Pound, 1925.)

Highly purified ethyl acetate was used. A slight excess of it was shaken with water at a temperature below that of the experiment and then placed in a thermostat. The excess of ethyl acetate then separating caused the liquid to become cloudy, but this disappeared in an hour or two. Care was always taken that the excess of ethyl acetate present was not large enough to require a correction for the amount of water dissolved by it. For analysis the saturated solution was weighed. The ethyl acetate was distilled out, hydrolyzed with standard Na OH, and estimated in the usual way.

ETHYL ACETATE

SOLUBILITY OF ETHYL ACETATE IN AQUEOUS SOLUTIONS.

(Glasstone and Pound, 1925; Glasstone, Dimond and Jones, 1926; Glasstone, Dimond and Harris, 1926.)

These authors have made a very careful and comprehensive study of the solubility of ethyl acetate in aqueous solutions of various salts and sugars. They give results at 25° and at 50° for aqueous solutions of Li Cl, Li Br, Li I, K Cl, K Br, K I, Na Cl, Na Br, Na I, Rb Cl, Rb Br, Rb I, Cs Cl, Cs Br, Cs I, NH₄ Cl, NH₄ Br, NH₄ I, dextrose, levulose, sucrose and lactose. They also give results at 25° for aqueous solutions of Na NO₃, Pb (NO₃)₂, NH₄ NO₃, CH₃ CO O NH₄, K Cr O₄, Ca (NO₃)₂, Sn (NO₃)₂, Ba (NO₃)₂, K NO₃, Ba Cl₂, Cu Cl₂, Ni SO₄, K₂ SO₄, (CO O NH₄)₂, Mg SO₄, Na₂ SO₄, Cu SO₄, Zn SO₄, K Fe (CN)₆, K₃ Fe (CN)₆, K Cl O₃, K F and various mixtures of these salts. The results are, however, all expressed « in terms of the number of *gram molecules of water* required to dissolve one gram molecule of ethyl acetate in the presence of various molecular quantities of added sugar or salt ». The experiments were made for the purpose of explaining the salting-out effect of various compounds. It was concluded from the results that the hydration of the salt may be one of the factors responsible for the salting-out effect; this effect may, however, be due to some other fundamental property of salt ions or molecules. The salting-out power of a mixture is, in general, equal to the sum of the salting-out powers of the constituents, provided allowance is made for the electrical interaction of the ions. The salting-out effect cannot be utilized for the detection of complex ion formation.

In spite of the undoubted interest of these results as quantitative solubility measurements, their recalculation to the more usual terms of expression would involve a considerable effort. Furthermore, since they are published in one of the most easily accessible journals there appears less need for their reproduction in the present compilation.

BUTYRIC ACIDS (normal) CH₃(CH₂)₂COOH; (iso) (CH₃)₂CH.COOH.

SOLUBILITY OF NORMAL BUTYRIC ACID IN WATER, DETERMINED BY THE FREEZING-POINT METHOD. (Faucon, 1909, 1910.)

t° of Congealing.	Gms. Acid per 100 Gms. Mixture.	t° of Congealing.	Gms. Acid per 100 Gms. Mixture.	t° of Congealing.	Gms. Acid per 100 Gms. Mixture
0	0	- 3.57	67.38	-13.40	87.62 Eutec.
-1.08	5.12	- 5.20	75	-12.40	90.08
-2.70	12.75	- 6.80	80	-10	95.92
-2.96	25.32	- 8.61	84	- 8	98.60
-3.07	50.60	-10.25	85.41	- 5.40	99.15
-3.14	59.72	-12.54	86.54	- 3.12	100

Higher values for the temperature of congealing of the above mixtures are given by Ballo (1910). For additional data see also Timmermans (1907) and Tsakalotos (1914). Data for the miscibility of normal butyric acid and water are also given by Faucon. The curve is entirely in the metastable region. The mixtures are either opalescent or completely homogeneous and never form two distinct layers, even with the application of centrifugal force. The results are as follows:

t° of opalescence	-5.2	-4.2	-4	-3.8 crit. t.	-4.5	-7
Gms. acid per 100 gms. mixture	25	30	35	40	50	58.2

SOLUBILITY OF ISOBUTYRIC ACID IN WATER, DETERMINED BY THE FREEZING-POINT METHOD. (Faucon, 1910.)

The congealing temperatures for mixtures containing up to 60 grams isobutyric acid per 100 gms. coincide with the results given in the above table for normal butyric acid and water. For higher concentrations the following results were obtained.

t° of congealing	-3.09	-3.35	-3.61	-12.5	-80
Gms. acid per 100 gms. mixture	70.10	82.08	86.44	97.21	100

MISCIBILITY OF ISOBUTYRIC ACID AND WATER, DETERMINED BY THE "SYNTHETIC METHOD."

(Smirnov, 1907.)

t°.	Gms. Acid per 100 Gms.:	
	Upper Layer.	Lower Layer.
10.05	69.08	17.82
12	67.1	18.3
14	64.9	19.1
16	62.3	20
18	59.2	21.1
20	55.4	22.8
22	49	25.8
22.5	46	27
23	41	29
23.3 crit. t.	34.7	

Determinations varying more or less from the above are given by Rothmund (1898), Friedlander (1901) and Faucon (1910). The discrepancies are shown by Smirnov to be due to the effect of variations in purity of the isobutyric acid upon the position of the curve. Smirnov fractionated the purest obtainable acid and determined the miscibility curve for each fraction. The above results were obtained with fraction 4 of boiling point 154°-155°, twice refractionated.

An extensive series of determinations are given by Smirnov of the effect of various percentages of different salts upon the temperature of immiscibility of aqueous 16.46% isobutyric acid solution.

A later determination of the reciprocal solubility of iso butyric acid and water at 20°, reported by Jones, 1929, agrees with the above result of Smirnoff, 1907.

Other determinations of the critical solution temperatures of mixtures of normal and of iso butyric acids and water are as follows:

Mixture	c.s.t.	Gms. $C_4H_8O_2$ per 100 gms. sat. sol.	Authority
Normal acid + H_2O	-1.1	26	Howard and Patterson, 1926.
" " + "	-4.1	—	Timmermans & Hennaut-Roland, 1932.
" " + "	-1.6	33	Patterson, 1938.
iso " + "	+17.7	30	Howard and Patterson, 1926.
" " + "	26.2	—	Timmermans and Delcourt, 1934.
" " + "	21.9	32	Patterson, 1938.

Results showing that the critical solution temperatures of normal and of iso butyric acids and water are raised respectively 23.6° and 19.5° by replacement of ordinary with heavy water (Deuterium Oxide) are given by Patterson, 1938. Timmermans and Poppe, 1935a, report an elevation of 23.45° in the case of normal butyric acid and heavy instead of ordinary water. A method for estimating various percentages of deuterium oxide in ordinary water, based upon the degree of elevation of the critical solution temperatures of normal and of iso butyric acids, is proposed by Patterson, 1938.

Results showing the elevation of the critical solution temperature of iso butyric acid and water caused by the presence of hydrochloric acid and of various salts and their mixtures are given by Carter and Megson, 1927.

THE MUTUAL SOLUBILITY OF ISO BUTYRIC ACID AND WATER AT HIGH PRESSURES. (Timmermans, 1922.)

The following determinations of the critical temperature of solution at high pressures are given.

The constants of the iso butyric acid were, b. pt. = 154°.35, f. pt. — 4°.7, $d_4^{20} = 0.96819$.

Pressure in kilograms.	Critical temp. of solution.	Pressure in kilograms.	Critical temp. of solution.
1	26.4	300	9.40
50	23.76	475	0.0
100	21.14	525	-2.6

NOTE. In the series of papers by Smith, 1921-1922, the results for the distribution of butyric acids are given under « *n* butyric acid » and « *sec.* butyric acid. » In the absence of any description or constants of either of the compounds it is assumed that *iso* butyric acid was employed in all cases referred to under « *sec.* butyric acid ».

4.0088	3.6544	0.3544
4.5342	4.1521	0.3821

The distribution ratio of normal butyric acid between water and benzene at room temperature was found by King and Narracott (1909), to be 1 to 0.7585, and for isobutyric acid, the ratio was 1 to 0.810.

One determination of the distribution of butyric acid between sat. aqueous $CaCl_2$ solution and kerosene gave 7.2 gms. acid per 100 gms. aqueous layer and 92.8 gms. per 100 gms. kerosene layer at ord. temp. (Crowell, 1918.)

DISTRIBUTION OF NORMAL BUTYRIC ACID BETWEEN WATER AND BENZENE AT 20°

Ethyl, Methyl, etc. **ALLOPHANATES** $NH_2.CO.NH.COOC_2H_5$.

SOLUBILITIES IN ETHYLALCOHOL AND, IN ETHER. (Réhal, 1919.)

As a method of isolation and identification, an extensive series of alcohols were converted into the corresponding allophanates by the action upon them of cyanic acid. This gas was prepared by the depolymerization of cyanuric acid at about 300° in a very slow current of CO_2 , and when passed into the cooled alcohol gave rise to the general reaction, $2 O.C.NH + C_2H_5OH = NH_2.CO.NH.COOC_2H_5$, which proceeded rapidly with evolution of heat and brisk solidification of the mixture. In each case the product, after cooling, was washed with ether, to remove unchanged alcohol and urethan, which is simultaneously formed in greater or less amount. The allophanates were then each purified by dissolving in warm alcohol, benzene or acetone and crystallizing by cooling. They were all crystalline and only slightly soluble in alcohol and ether. The author does not describe the procedure followed in determining the solubilities which he reports. In a private communication he states that a 10 cc. of each of the saturated solutions were evaporated to dryness and the residue weighed after standing in a desiccator containing sulfuric acid. The figures in parentheses show the melting-points of the allophanates.

A small scale diagram, without numerical data, is given for the above system by Brun, 1925. The critical solution temperature is stated to be 123.5° and the corresponding concentration, 37.5 gms. iso butyl alcohol per 100 gms. sat. solution. This author also gives two diagrams and several determinations of tie lines for the system iso butyl alcohol, ethyl alcohol and water.

BUTYL ALCOHOL (Secondary) $CH_3.CH(OH).CH_2CH_3$.

THE MUTUAL SOLUBILITY OF SECONDARY BUTYL ALCOHOL AND WATER AT HIGH PRESSURES. (Timmermans, 1922.)

The following data for the critical temperature of solution at high pressures are given.

The constants of the secondary butyl alcohol were: h, pt. -99.5°, d_{40} 0.82263.

Pressure in kilograms.	Critical temp of solution.	Pressure in kilograms	Critical temp of solution
1	The triphase system crystallizes at - 8°.5	800	58.6

Additional determinations of the reciprocal solubility of secondary butyl alcohol and water are given by Dolgolenko (1908). This investigator prepared three fractions of 98°-98.6°, 98.6°-99° and 99°-99.5° boiling point respectively, and determined the curve for each fraction and water by the "synthetic method." The first fraction gave a closed curve having both a lower and an upper critical solution temperature, while the other fractions gave curves with only an upper critical solution temperature, and in other respects in fair agreement with the results of Alexejew as shown in the above table. The explanation of this difference in the case of the first fraction, is supposed to be that this fraction contained a larger proportion of tertiary butyl alcohol than the others, due to the lower boiling point of this isomer. Since the tertiary alcohol is entirely miscible with secondary alcohol and water its presence would restrict the boundaries of inhomogeneity and, therefore, tend to favor a closed curve for the system.

SOLUBILITIES, DETERMINED BY THE FREEZING-POINT METHOD

ARE GIVEN FOR THE FOLLOWING MIXTURES CONTAINING BUTYL ALCOHOLS.

Isobutyl alcohol + Water	(Dreyer, 1913.)
" " + Liquid CO_2	(Büchner, 1905-06.)
Normal butyl alcohol + Water	(Dreyer, 1913.)
" " " + Liquid CO_2	(Büchner, 1905-06.)
Secondary butyl alcohol + Water	(Dreyer, 1913; Timmermans, 1907, 1910, 1911.)
" " " + " + Hydroquinine	(Timmermans, 1907.)
Tertiary butyl alcohol + Water	(Dreyer, 1913.)

100 gms. sat. solution of sec. Butyl Alcohol in Water contain 20 gms. $CH_3CHOHCH_2CH_3$ at 20°.

100 gms. sat. solution of Water in sec. Butyl Alcohol contain 37 gms. H_2O at 20°. (Jones, 1929.)

SOLUBILITY OF ISO BUTYL ALCOHOL IN WATER.

(Janecke, 1933.)

The determinations were made by the synthetic, sealed tube, method.

t°	Gms. $(CH_3)_2CH.CH_2OH$ per 100 gms. sat. sol.	t°	Gms. $(CH_3)_2CH.CH_2OH$ per 100 gms. sat. sol.

100 cc. H₂O dissolve 8.11 cc. ether at 22°; vol. of solution, 107.145 cc., Sp. Gr. 0.9853.

100 cc. ether dissolve 2.93 cc. H₂O at 22°; vol. of solution, 103.282 cc.; Sp. Gr. 0.7164. (Herz, 1898.)

More recent determinations of the solubility of ethyl ether in water, agreeing closely with the above data, are given by Osaka, 1910.

Data for the temp.-pressure diagram of ether-water are given by Scheffer, 1912a.

RECIPROCAL SOLUBILITY OF ETHER AND WATER.

(Hill, 1923; Kablukov and Malischeva, 1923.)

A new method for the determination of the reciprocal solubility of liquids was employed by these authors. It depends upon the simple application of the phase rule to the volumes obtained by mixing the two liquids in two different ratios by weight, in two separate experiments at the same temperature. The apparatus consists of flasks with two bulbs of 100 cc. and 300 cc. respectively, having the stem between the bulbs and above the upper bulb, very accurately graduated and calibrated. The method of calculation employed eliminates the correction for change of volume on mixing and enables the solubilities to be calculated directly from the volumetric readings. The flasks were rotated 1/2 hour in a thermostat and allowed to stand 1/2 hour before reading the volume changes.

The Solubility of Ether in Water.

25.0....	0.987 ⁽¹⁾	6.00 ⁽¹⁾	6.05 ⁽²⁾	0.714 ⁽¹⁾	1.19 ⁽¹⁾

⁽¹⁾ Forbes and Coolidge, 1919; ⁽²⁾ Thorne, 1921; ⁽³⁾ Per 100 cc. H₂O, Linder, 1917, 1920, ⁽⁴⁾ Per 100 cc. H₂O, von Euler and Svanberg, 1917, 1917a, 1926. The results in parentheses are by Boutin and Sanfourche, 1919.

Later determinations by Bennett and Philip, 1928, using the same method as Hill but reducing the quantities of liquid gave results in very close agreement with those of Hill.

One determination at 20° by Jones, 1929, gave 6.95 gms. (C₂H₅)₂O per 100 gms. aqueous layer and 1.2 gms. H₂O per 100 gms. ether layer.

Determinations of the effect of a third substance (CdI₂, ZnI₂ and UO₂(NO₃)₂) upon the mutual solubility of ethyl ether and water are given by Guempel, 1929.

FREEZING-POINTS OF MIXTURES OF ETHYL ETHER AND WATER.

Data for the system ethyl ether, ethyl alcohol, water, sulfuric acid at 0° are also given.

Data showing the influence of Cadmium Iodide upon the mutual solubility of Ethyl Ether and Water are given by Guempel, 1929. This author also gives complete data for the system Ethyl Ether + H_2O + CdI_2 . Similar data are also given for the systems Ethyl Ether + H_2O + ZnI_2 and for Ethyl Ether + H_2O + $UO_2(NO_3)_2$.

Data for the solubility of ethyl ether in carbon dioxide at high pressures are given by Sander (1911-12). The determinations were made by using quite small amounts of ether and observing the pressure at which a drop of liquid just appeared or disappeared in a mixture of known weight per cent composition. The results give the "gas curve" for constant temperature and when plotted in connection with the "liquid curve" (see *VOL. I* p. 234), give the complete pressure-concentration diagram.

Freezing-point lowering data for mixtures of ethyl ether and hydrochloric acid are given by Maass and McIntosh (1913).

SOLUBILITY OF ETHER IN AQUEOUS SALT, ETC., SOLUTIONS AT 18°.

Purified ether prepared from methylated spirit gave slightly higher results.

SOLUBILITY OF ETHER IN AQUEOUS SOLUTIONS OF SODIUM CHLORIDE. (Thorne, 1921)

The solutions were saturated by constant shaking for 3 1/2 to 4 hours.

The ether was determined by passing a current of dry air through a weighed amount of the saturated solution and calculating from the observed loss in weight.

von Euler and Svanberg, 1917, 1917 *a*, 1926, found 4.5 gms. (C₂H₅)₂O per 100 cc. of aq. 1.0 normal NaCl at 18°.

SOLUBILITY OF ETHER IN AQUEOUS SOLUTIONS AT 18°. (Linde, 1917, 1926)

The determinations were made by rotating together in a sealed flask at 18°, 50 cc. of the solvent and such volumes of ether, that, after the period of rotation, not more than 0.5 cc. remained undissolved. The weight of dissolved ether was found by multiplying the volume by the $d_{18} = 0.716$.

The solubility of Di Ethyl Amine in Water at 60°, calculated from the vapor pressures, determined by an aspiration method is given by Doyer, 1890, as 89 in terms of the Ostwald Solubility Experiment and 73 in terms of the Bunsen Absorption Coefficient at a vapor pressure of 233 mm Hg.

Freezing-point data for mixtures of Di ethyl amine and water are given by Guthrie, 1884, and Pickering, 1894.

DIETHYL AMINE Hydrobromide, Hydrochloride and Hydroiodide.

SOLUBILITY OF EACH SEPARATELY IN WATER AND IN CHLOROFORM AT 25° (Peddle and Turner, 1913.)

(Lange and Mueller, 1930.)FURFURAL C₄H₄O.CHO.

RECIPROCAL SOLUBILITY OF FURFURAL AND WATER.

(Mains, 1922; Evans and Aylesworth, 1926.)

The determinations of Mains were made by shaking together furfural and water at nearly constant temperature for 100 times. After separation, the two layers were analyzed by measurement of their densities and comparing with a concentration-density chart. The determinations of Evans and Aylesworth were made by the sealed tube synthetic method and precautions were taken to secure the highest accuracy.

EQUILIBRIUM IN THE SYSTEM FURFURAL, ISO AMYL
ACETATE AND WATER AT 25°
(Lloyd, Thompson and Ferguson, 1935)

The determinations of the binodal curve were made by the titration method. To mixtures of weighed amounts of two of the components, the third was added from a weight buret equipped with a long fine delivery tip. Tie lines were obtained from weights of the two phases separating from a mixtures of known composition or from their weights and the furfural content of the furfural rich phase.

20	0.006	60	0.0230	100	0.0625

One liter of very carefully purified CO₂ free water dissolves 0.0251 gm. uric acid at 18°. Constant agitation and temperature were employed. With finely divided uric acid, saturation was reached after one hour. The amount dissolved was determined by the difference in weight between the amount of sample taken and that remaining undissolved.

(Blaess and Deniges, 1931)

One liter of pure CO₂ free water dissolves 0.0649 gm. uric acid at 37°. The amount dissolved was determined by difference and only 20-25 minutes agitation allowed for saturation. It is stated that on long contact with water, the uric acid breaks down and the solubility and conductivity increase directly with time.

(Blaess, 1930)

One liter of water dissolves 0.0645 gm. uric acid at 37°. (Blaess and Deniges, 1931)

One liter of serum dissolves 0.9 gm. uric acid at 37°.

SOLUBILITY OF URIC ACID IN AQUEOUS SOLUTIONS OF ACID AT 18°.

(His, Jr. and Paul, 1900.)

Acid.	Concentration of Aq. Acid.		Gms. Uric Acid per 1000 cc. Sat. Sol.
	Normality.	Per cent.

	3.2	15.67	0.0205
	6.4	31.34	0.0183

Additional data for the solubility of uric acid in aqueous sulfuric acid are given by Tafel (1901). A saturated solution of crystallized uric acid in 80 wt. per cent aqueous H₂SO₄ was prepared by warming to about 120° and allowing to stand. Portions of the clear solution were diluted with increasing amounts of water and the mixtures allowed to stand many days in closed flasks which were frequently shaken. The precipitated uric acid was then filtered off and weighed and the amount remaining in solution calculated by difference. The following results were obtained.

Wt. % of aq. H ₂ SO ₄	72.5	70.5	68	66.5	62.5	59.5
Gms. uric acid per 100 gms. aq. H ₂ SO ₄	6.45	3.85	1.60	0.64	0.35	0.312

INFLUENCE OF HYDROGEN ION CONCENTRATION UPON THE SOLUBILITY OF URIC ACID.
(Jung, 1922, 1923.)

An excess of uric acid was shaken for two hours with buffer mixtures of determined p_H values and the solution either filtered immediately or after 1 or 2 days. The dissolved uric acid was usually determined with Polin's uric acid reagent (phosphotungstic acid) and the standard solution of Benedict. The following results were obtained at the temperatures shown in parentheses with uric acid as the starting material and the indicated buffer mixtures. The calculated results were obtained with the aid of the Michaelis formula derived on the basis of the mass action law.

Results are also given for determinations made at 37° and with sodium urate as the starting material. The influence of the anion present and of the time of shaking and of standing was also studied. Similar curves were obtained in all cases and they show that the greatest effect upon the solubility of uric acid, resulting

THE SOLUBILITY OF URIC ACID IN BUFFER SOLUTIONS AT 37°.
(Harpuder and Ebbon, 1924.)

Buffer mixtures were prepared with primary and secondary sodium phosphate, sodium acetate and acetic acid, and sodium lactate and lactic acid. Each was diluted to 100 cc. with distilled or conductivity water. An excess of a weighed amount of the purest uric acid was added to each solution and the mixture shaken in a thermostat one-fourth of an hour and then allowed to stand one hour. The undissolved uric acid was filtered out and weighed, and that dissolved calculated by difference. A direct determination of the uric acid in the saturated solution was also made by titration with sulfuric acid and potassium permanganate. The average of the two determinations was taken as the solubility in each buffer mixture. A determination of the *pH* of each saturated solution was made with the gas chain.

The curves obtained by plotting the above results show that the solubility of uric acid in acetate and lactate buffer mixtures differs from that in phosphate buffers. Additional evidence on this point, and on the marked tendency of uric acid to form supersaturated solutions, was desired. Further determinations were therefore, made by Harpuder, 1924, using a method designed to show more clearly the effect of the anion (at higher concentrations) upon the solubility of uric acid.

An amount of dried uric acid, which was chosen to yield an equal excess in all cases, was dissolved by warming, in a portion of the alkaline part of the buffer mixture. The remaining portions were then added in amounts such that the concentration of Na⁺ remained constant, and the mixture was diluted to 40 cc. The amount of added uric acid was controlled by a colorimetric determination made with phosphotungstic acid and sodium xanthyne. The mixture was shaken one-fourth of an hour at 37° and then allowed to stand at this temperature for 16 hours. It was then filtered and the uric acid again determined colorimetrically in one portion of the filtrate and the *pH* measured in another by means of the gas chain.

The p_H corresponding to the beginning of precipitation of uric acid or urate was considered to be a more satisfactory indication of the solubility influence than the amount of uric acid dissolved. The results of such measurements, made under conditions so chosen that all factors remained constant except the concentration of the anion, showed that the precipitation of uric acid from :

Phosphate buffer mixture begins at p_H = about 6.8

Acetate " " " " " " 4.9

Lactate " " " " " " 4.2

On the basis of many experiments and calculations it was concluded that the failure of the excess of mono urate to precipitate from its supersaturated solution depends upon the simultaneous presence of undissociated uric acid and *diurate*, and accordingly is possible first at a definite p_H upwards of > 6.7 to 6.8. The failure of uric acid complexes to precipitate from acetic acid and lactic acid mixtures is caused by supersaturation of undissociated uric acid due to the buffer acid. Non electrolytes and colloids may favorably influence the holding of uric acid complexes in solution.

By constant agitation at 14° , 0.1 to 0.5 for more than 24 hours Biltz and Herrmann, 1923, found that 1000 cc. water dissolve 0.0223 gm. uric acid when equilibrium was approached from below, and 0.0295 gm. when equilibrium was approached from above.

DISTRIBUTION OF PYRIDINE BETWEEN WATER AND BENZENE AT 25°
(Woodman and Corbet, 1925)

Measured volumes of benzene, water and pyridine were placed in stoppered graduated cylinders. The mixtures were maintained at 25° for 6 hours and vigorously shaken periodically. The volume of the two layers was noted and known volumes of each weighed and the pyridine in them determined by titration with normal acid, using methyl orange as indicator. The volume of benzene was measured.

METHYL TRICHLORO β HYDROXY BUTYRATE $CCl_3CHOHCH_2COOCH_3$.

Freezing-point data for mixtures of the isomerides of methyl tri chloro β Hydroxy Butyrate are given by Ross, 1936.

DI ACETYL METHYL d TARTRATE $(CHOCOCH_3CO_2CH_3)_2$.

Freezing-point data for mixtures of the d and l compound are given by Findlay and Campbell, 1928.

ACETYLACETONE CH₃COCH₂COCH₃.**SOLUBILITY IN WATER.**

(Rothmund — Z. phys. Ch. 26, 475, '98.)

t°.	Gms. CH ₃ COCH ₂ COCH ₃ per 100 Gms.	
	H ₂ O Layer.	Acetyl Acetone Layer.
30	15.46	95.02
40	17.58	93.68
50	20.22	91.90
60	23.23	89.41
70	27.10	85.77
80	33.92	78.82
87.7 (crit. temp.)	56.8	

NOTE. — Weighed amounts of water and acetyl acetone were placed in small glass tubes, which were then sealed and slowly heated until the contained mixtures became homogeneous. The temperature was then allowed to fall very gradually and the point noted at which cloudiness appeared. This point was accurately established for each tube by repeated trials. The curve plotted from these determinations shows two percentage amounts of acetyl acetone which cause cloudiness at each temperature below the critical point. Of these two points, for each temperature, one represents the aqueous layer, i.e., the solubility of acetyl acetone in water; and the other represents the acetyl acetone layer, i.e., the solubility of water in acetyl acetone. This method is known as the 'Synthetic Method,' and yields results in harmony with those obtained by the analytical method, i.e., by analyzing each layer after complete separation occurs.

100 gms. sat. sol. of Acetyl acetone in ordinary water (H₂O) contain 17.05 gms. C₅H₈O₂ at 19.5°.

100 gms. sat. sol. of Acetyl acetone in heavy water (D₂O) contain 10.6 gms. C₅H₈O₂ at 19.5°. (Nachod, 1938.)

24	24	48.25

100 grams H_2O dissolve 1.7 grams ethyl propionate at 22° (Traube, 1884.)

Freezing-point data for mixtures of ethyl propionate and ethyl formate are given by Timmermans, 1918.

METHYL BUTYRATE $C_4H_9COOCH_3$.

100 gms. H_2O dissolve 1.0 gm. methyl butyrate at 22° (Traube, 1884.)

VALERIC ACID n $CH_3(CH_2)_3COOH$ (n Propyl Acetic Acid).

When valeric acid is shaken with water at 16°, two layers are formed.

100 gms. of the aqueous layer contain 3.4 gms. $CH_3(CH_2)_3COOH$.

100 gms. of the acid layer contain 90.4 gms. $CH_3(CH_2)_3COOH$.

(Lieben and Rossi, 1871.)

DISTRIBUTION OF VALERIC ACID BETWEEN BENZENE AND 95.8% SULFURIC ACID.

(Gurwitsch, 1914.)

The mixtures were made at 0° and brought to equilibrium by shaking for 5 minutes at 18°, and allowing to stand over night.

Data are also given by Stoltzenberg for the following basic salts of betaine (C₅H₁₁O₂N)₂HCl.H₂O, (C₅H₁₁O₂N)₂HBr, (C₅H₁₁O₂N)₂HI, (C₅H₁₁O₂N)₂HSO₄ and (C₅H₁₁O₂N)₂HAuCl₄.H₂O.

dl VALINE (CH₃)₂CHCH(NH₂)COOH.

SOLUBILITY OF dl VALINE IN WATER.

(Dalton and Schmidt, 1933.)

The following values were derived from a solubility equation based upon 52 very careful determinations made at 15 temperatures between 0° and 80°. Density determinations upon dilute aqueous valine solutions are also given. The d₂₅ of a 7.4 percent solution is 1.01387.

F.-pt. data for mixtures of hexachloro- α -keto γ -R-pentene, C₆Cl₆O, + penta chloromonobromo α -keto γ -R-pentene, C₅Cl₅BrO, are given by Küster (1890, 1891).

The critical solution temperature of mixtures of pentane and Sulfur Dioxide is at 2.0° and there is approximately 75 Mol. percent SO₂ present, (Leslie, 1934.)

The critical solution temperature of mixtures of iso pentane and o nitro toluene is 8.65°. That of mixtures of iso pentane and m nitro toluene is 7.05°. (Hennant-Roland, 1933.)

HYDROCARBONS.

In connection with the use of liquid sulfur dioxide for the fractionation of mixtures of hydrocarbons, many determinations have been made of the solubility of aromatics, paraffines, olefins and naphthenes in this solvent. A general review of the subject and many new experiments are given by Moore, Morrell and Egloff, 1918. The methods are, however, more in the nature of fractional extraction processes than equilibria studies. Mixtures of various proportions of liquid sulfur dioxide and oil were shaken together, usually at -18° or -10°, and, after separation of the two layers, each was freed of SO₂ and its density and refractive index determined. It was found in general that the paraffines (pentane, hexane, octane, nonane and decane) are completely insoluble and the aromatics and olefins (benzene, toluene, xylene, mesitylene, hexylene, and caprylene) completely soluble in liquid sulfur dioxide. Naphthalene and cyclohexane varied in solubility depending upon the ratio of SO₂ used. Data for a great variety of synthetic mixtures of hydrocarbons are given and it was found that within certain limiting concentrations: (a) Aromatics may be separated from paraffins or naphthenes, (b) Olefins may be separated from paraffins or naphthenes, (c) Aromatics and olefins together may be separated from paraffins or naphthenes, (d) Naphthenes may be separated from paraffins. The particular advantage of the method is that the separated unsaturated and aromatic oils may be recovered and their identity proven by further physical tests.

Freezing-point data are given for mixtures of:

Pentane	+ Iso pentane	(Ormandy & Craven, 1921; Saphir, 1929.)
"	+ Methyl cyclohexane	(Timmermans, 1934.)

AMYL ALCOHOL $C_5H_{11}OH$.

SOLUBILITY OF AMYL ALCOHOL IN WATER AT 22°.

(Herz — Ber. 31, 2671, '98.)

100 cc. water dissolve 3.284 cc. amyl alcohol. Sp. Gr. of solution = 0.9949, Volume = 102.99 cc.

100 cc. amyl alcohol dissolve 2.214 cc. water. Sp. Gr. of solution = 0.8248, Volume = 101.28 cc.

Sp. Gr. of H_2O at 22° = 0.9980; Sp. Gr. of amyl alcohol at 22° = 0.8133.

100 gms. sat. solution of normal amyl alcohol in water contain 2.208 gm. $C_5H_{11}OH$ at 25°. (Butler, Thomson and MacLennan, 1933.)

100 gms. H_2O dissolve 5.2 gm. Amyl Alcohol at 20°. (Smith, 1932.)

SOLUBILITY OF AMYL ALCOHOL IN WATER AND IN AQUEOUS SOLUTIONS OF ETHYL AND METHYL ALCOHOLS.

* Of 33.55 per cent C_2H_5OH .

† Of 33 per cent CH_3OH .

The "synthetic method" was used for the preceding determinations. Fermentation amyl alcohol of b. pt. 131°-131.4° and $d_{15.5} = 0.814$ was employed. It contained 16% of optically active amyl alcohol. Many other series of determinations were made with solvents containing other percentages of ethyl and methyl alcohol. Also, other series were made for the above-named ternary systems at constant temperatures from which binodal curves were obtained. The author uses a very ingenious indirect method for determining the composition of the conjugated solutions. Data are also given for the distribution of ethyl alcohol between water and amyl alcohol.

SOLUBILITY OF AMYL ALCOHOL IN AQUEOUS SOLUTIONS OF ETHYL ALCOHOL.

* Just enough water was added to produce cloudiness.

NOTE. — The effect of various amounts of a large number, of, salts upon the temperature (39.8°) at which a mixture of 20 cc. of amyl alcohol + 20 cc. of ethyl alcohol + 32.9 cc. of water becomes homogeneous has been investigated by Pfeiffer (Z. phys. Ch. 9, 444, '92). The results are no doubt of interest from a solubility standpoint, but their recalculation to terms suitable for presentation in the present compilation has not been attempted.

ISOAMYL ALCOHOL (CH₃)₂CH.(CH₂)₂OH.

RECIPROCAL SOLUBILITY OF ISOAMYL ALCOHOL AND WATER.
(Kablukov and Malischeva, 1925.)

A volumetric method, apparently identical with that described by Hill, 1923, was used. The method of calculation eliminates the correction for change of volume on mixing and permits direct estimation from the volumetric results.

The figures in parentheses are the densities of the respective phases at 25/4°.

RECIPROCAL SOLUBILITY OF SIX ISOMERIC ETHERS AND WATER,
EACH DETERMINED SEPARATELY.

(Bennett and Philip, 1928.)

The method of Hill, 1923, was modified by greatly reducing the volumes of liquid and adding a globule of mercury to the small sealed tube to hasten the mixing and attainment of equilibrium.

Iso **AMYLAMINE HYDROCHLORIDE** C₅H₁₁.NH₂.HCl (iso).

100 gms. H₂O dissolve 192.2 gms. of the salt at 25°. (Peddle and Turner, 1913.)
 100 gms. CHCl₃ dissolve 5.1 gms. of the salt at 25°.

Data for the distribution of *ε*-chloramyl amine between water and tetrachlorethane at 0°, water and nitrobenzene at 25° and water and benzene at 25° are given by Freundlich and Richards (1912).

CHOLINE PERCHLORATE and its Nitric Ether.

100 gms. H₂O dissolve about 290 gms. (CH₃)₃N(ClO₄)CH₂CH₂.OH at 15°. (Hofmann
 100 gms. H₂O dissolve 0.62 gm. (CH₃)₃N(ClO₄)CH₂CH₂.ONO₂ at 15°. } and
 100 gms. H₂O dissolve 0.82 gm. " " at 20°. } Hobold, 1911.)

NEURINE PERCHLORATE CH₂.CH.N(CH₂)₃.OH HClO₄.

100 gms. H₂O dissolve 4.89 gms. of the salt at 14.5°. (Hofmann & Hobold, 1911.)

HEXA BROMO BENZENE CBr₆.

100 cc of 96% Ethyl Alcohol dissolve 0.0068 gm. CBr₆ at 20°.
 100 cc of Methyl Alcohol (d = 0.7975) dissolve 0.076 gm. CBr₆ at 20°.

HEXA CHLORO BENZENE CCl₆.

100 gms. para cymene dissolve 2.93 gms. Hexachloro Benzene at 23°.5,
 16.77 gms. at 100° and 106.95 gms. at 176°. (Wheeler, 1920.)

Freezing-point data for mixtures of α and β Hexachloro Benzene are given by Nagornow, 1911.

TRI CHLORO TRI NITRO BENZENE $C_6Cl_3(NO_2)_3$.RECIPROCAL SOLUBILITY OF TRICHLORO TRINITRO BENZENE AND
HEXAMETHYL BENZENE.

(Hammick and Hellicar, 1936.)

TETRA CHLORO BENZENE $C_6H_2Cl_4$.

Freezing-point data for mixtures of tetrachloro benzene with ethylene chloride and with p dichloro benzene are given by Timmermans, 1934.

TRI BROMO NITROSO BENZENE $C_6H_2Br_3NO$.

Freezing-point data for mixtures of tribromo nitroso benzene and nitroso mesitylene are given by Hammick, Edwards, Illingworth and Snell, 1933.

2.6 Dibrom QUINONE ChlorIMIDE $O:C_6H_2Br_2:NCl$.1000 cc. sat. solution of 2.6 dibrom quinone chlorimide in water contain 0.0002 gm. mol. or 0.06 gm. $O:C_6H_2Br_2:NCl$ at 20° . (Gibbs, 1927.)2.6 Dibrom QUINONE OXIME $O:C_6H_2Br_2:NOH$.1000 cc. sat. solution of 2.6 dibrom quinone oxime in water contain 0.00085 gm. mol. or 0.2388 gm. $O:C_6H_2Br_2:NOH$ at 20° . (Gibbs, 1927 a.)TRICHLORO PHENOL $OHC_6H_2(2.4.6)Cl_3$.

Freezing-point data are given for:

Tri chloro phenol	Di phenylamine (Giua and Cherchi, 1919.)
" " "	Styphnic acid (Jänecké and Rahlfs, 1932.)

PICRYL CHLORIDE C₆H₂(2)Cl(1.3.5)(NO₂)₃.

Freezing-point data are given for mixtures of Picryl Chloride and:

Acenaphthene (1)(6)	Naphthalene (1)(2)(6)
Anthracene (1)(6)	Picric acid (1)(6)
Acenaphthylene (6)	Phenanthrene (6)
Benzene (3)	Pyrene (5)
Diphenyl butadien (4)	Retene (1)(6)
Fluorene (1)(6)	Tri nitro phenol (2)
Fluor anthene (5)	Tri nitro toluene (2)

(1) Jefremow, 1918; (2) Grim, Gunther and Titus, 1931; (3) Hammick, Hill and Howard, 1932; (4) Kuhn and Wagner-Jouregg, 1921; (5) Shinomiya, 1940; (6) Efremov, 1918.

Results for mixtures of Picryl Sulfide and Tolite are given by Roche and Thomas, 1923.

CHLORO TRI NITRO BENZENE C₆H₂(1)Cl(2.4.6.)(NO₂)₃.

SOLUBILITY OF 1 CHLORO 2.4.6 TRINITRO BENZENE IN WATER.
(Desvergues, 1925, 1931.)

(1) The compound 2 C₆H₂(NO₂)₃OH.5C₆H₅N is formed.

Results are also given for the freezing-points of mixtures of Chloro tri nitro benzene and Chloro 2.4 Di nitro benzene

DICHLORO DINITRO BENZENES C₆H₂Cl₂(NO₂)₂.

Freezing-point data are given for:

1.3 Dichloro, 4.6 Dinitro Benzene + 1,3 Dichloro, 2.4 Dinitro Benzene.
(Dann, 1929.)

1.4 Dichloro 2.5 Dinitro Benzene + 2.6 Dinitro Benzene

TETRA NITRO BENZENE $C_6H_2(NO_2)_4$.

Freezing-point data for mixtures of Tetra nitro Benzene and each of the following compounds: Acenaphthene, Anthracene, Fluorene, Phenanthrene, Pyrene, α and β Nitro Naphthalene, β Naphthyl Acetate and β Methyl Naphthoate are given by Shimoniya, 1940.

TRI BROMO BENZENE $C_6H_3Br_3$.

100 gms. H_2O dissolve 0.004 gm. $C_6H_3Br_3$ at $20-25^\circ$.
 " " Pyridine dissolve 24.3 gm. $C_6H_3Br_3$ at $20-25^\circ$.
 " " Aq. 50% Pyridine dissolve 2.01 gm. $C_6H_3Br_3$ at $20-25^\circ$.
 (Dehn, 1917.)

TRI CHLORO BENZENE $C_6H_3Cl_3$.

Freezing-point data for mixtures of 1.2.3, 1.2.4 and 1.3.5 tri chloro benzenes are given by Vander Linden, 1911, 1912.

s TribromoPHENOL $C_6H_2Br_3OH$.

Data for the solubility of mixtures of symmetrical tribromophenol and symmetrical trichlorophenol in diluted methyl alcohol at 25° are given by Küster and Würfel (1904-05). The results are presented in terms which are not clearly explained.

SOLUBILITY OF MIXTURES OF s TRIBROMO PHENOL AND s TRICHLORO PHENOL
 IN METHYL ALCOHOL AT 25° .

Dolinski does not refer to the previous determinations of Findlay.

100 gms. H₂O dissolve 1.525 gms. C₆H₃OH.(NO₂)₃ at 30° and 1.868 gms. at 40°.

100 gms. H₂O dissolve 1.45 gms. C₆H₃OH.(NO₂)₃ at 20°.

100 gms H₂O containing 5 gms. H₂SO₄ per liter, dissolve 0.61 gm. C₆H₃OH(NO₂)₃ at 20°.

(Karpus, 1907)

(Sisley, 1902)

Additional data for the distribution of picric acid between water and amyl alcohol and water and toluene at 20° are given by Sisley (1902). Very irregular results were obtained. The fact that the colors of the two layers are different, was taken to indicate that the picric acid dissolves in a different molecular form in the two layers.

Additional results for the distribution of picric acid between water and benzene are given by Rothmund and Ducker, 1903.

Data for the distribution of picric acid between water and mixtures of chloroform and toluene at 25°, are given by Herz and Kurzer, 1910.

DISTRIBUTION OF PICRIC ACID BETWEEN BENZENE AND
MIXTURES OF LIGHT AND HEAVY WATER AT 18°.

(Gross and Wischin, 1936.)

A 0.02979 molal solution of picric acid in benzene was used for all experiments. Picric acid was determined by titration using phenolphthaleine as indicator. Micro pipets were used for measuring the volumes. The D_2O percentage of the water was determined by density measurements. One cc. of water was shaken with 1 cc. of the standard picric acid solution in benzene in sealed tubes. After equilibrium was attained 0.5 cc of each layer was titrated.

SOLUBILITY OF PICRIC ACID IN MIXTURES OF SOLVENTS AT 12°.
(Angelescu and Dumitrescu, 1923.)

The mixtures of solvents were saturated with picric acid at 25°-30° and then the excess of picric acid was allowed to crystallize out while the solutions were kept in a thermostat at 12°. Thus constant agitation was not employed. The solutions were analyzed by evaporating the solvent at room temperature, dissolving the residue of picric acid and titrating it with 0.1 N KOH, using phenolphthalein as indicator.

Freezing-point data for mixtures of *o*, *m* and *p* Dichloro benzenes are given by Holleman & Van der Linden, 1911; Wibaut, Van der Linden and Walagh, 1937.)

Results for mixtures of Dichloro benzenes and:

Bromo benzene (Timmermans, 1934.)
 Bromo chloro benzene (Bruni and Gorni, 1899.)
 Chloro benzene (Timmermans, 1934.)
 Chloro iodo benzene (Nagornow, 1911.)
 Chloro phenol (Burnham and Madgin, 1936.)
 Di bromo benzenes (Bruni and Gorni, 1899, 1900; Küster and Würfel, 1904-5; Kruyt, 1912; Deffet, 1938.)
 Di bromo benzenes + C₂H₅OH (Meyer, 1922; Smits, 1920.)
 Di chloro benzene (Timmermans, 1934.)
 Di iodo benzene (Nagornow, 1911.)
 Di phenyl (Morris and Cook, 1935.)
 Fluoro benzene (Timmermans, 1934.)
 Naphthalene (Morris and Cook, 1935.)
 Nitro benzene (Hrynakowski and Szynt, 1938a.)
o Chloro toluene (Timmermans, 1934.)
o Cresol (Glass and Madgin, 1934.)
p Toluidine (Glass and Madgin, 1934.)
 Tetra chloro benzene (Timmermans, 1934.)
 Tri phenyl methane (Morris and Cook, 1935.)

CHLORO IODO BENZENE *p* C₆H₄ClI.

Freezing-point data are given for mixtures of:

Chloro iodo benzene + di iodo benzene (Nagornow, 1911; Rheinboldt and Kirscheisin, 1926.)
 Chloro iodo benzene + di chloro benzene (Nagornow, 1911.)
 Di iodo benzene + bromo iodo benzene (Rheinboldt and Kirscheisin, 1926.)

TRI BROMO ANILINE C₆H₂NH₂(2.4.6).Br₃.

Freezing-point data for mixtures of tri bromo aniline and tri nitro phenol are given by Hertel, 1924.

BROMO NITROSO BENZENE C₆H₄BrNO.

Freezing-point data are given for mixtures of:

Bromo nitroso benzene + Nitroso anisole (Hamrick, Edwards, Illingsworth and Snell, 1933.)
 " " " *m* Nitro nitroso benzene "

QUINONE CO <(CH₃CH)₂> CO.

100 cc. sat. sol. of Quinone in water	contain	1.37 gm. CO <(CH ₃ CH) ₂ > CO at 25°
" " "	0.1 <i>N</i> HCl	" 1.38 " " "
" " "	1.0 <i>N</i> HCl	" 1.44 " " "

(Granger and Nelson, 1921.)

The solubility of Quinone in Water at 25°, determined by interferometer readings, is 1.51 gms. C₆H₄O₂ per 100 cc H₂O. The solubility in 99.8% D₂O (heavy water) is exactly the same. (Korman and LaMer, 1936.)

SOLUBILITY OF QUINONE IN AQUEOUS SOLUTIONS OF HYDROCHLORIC ACID

SOLUBILITY OF QUINONE IN AQUEOUS SALT SOLUTIONS
(Linderström-Lang, 1924)

On account of the instability of quinone at lower concentrations of hydrogen ions the aqueous salt solutions were made up from HCl instead of pure water. The results, therefore, show, in all cases, the solubility of quinone in aqueous solutions containing both HCl present in excess of concentration, and the several salts present in the concentrations shown in the table. A constant rotation in a thermostat for 3 to 4 hours was employed. The quinone was prepared by distilling a raw quinone with water vapor. The titrations were made according to Knecht and Hibbert (*Ber.*, 44, 1135, 1910), with titanium chloride in acid solution, and retitration with iron alum, using potassium salicylate as indicator.

COMENIC ACID $C_6H_4O_5$.

100 gms. sat. sol. in water contain 0.51 gm. $C_6H_4O_5$ at 25°. (Verkade, 1924.)

" " in 0.5 molecular H_3BO_3 solution contain 0.51 gm. $C_6H_4O_5$ at 25°

Dinitro **PHENOLS** C₆H₃OH(NO₂)₂ 1.2.3; 1.2.4; 1.2.5 etc.

SOLUBILITY OF ISOMERIC DINITRO PHENOLS, EACH SEPARATELY, IN WATER.
(Sidgwick and Aldous, 1921; Sidgwick and Taylor, 1922.)

The determinations were made by the sealed tube method. The temperature of appearance of two layers, or of disappearance of the last crystal was determined. In indicating the structure of the isomers the hydroxyl group is always assumed to occupy position 1.

RESULTS FOR THE 1.2.3 COMPOUND :

Gms. C ₆ H ₃ OH(NO ₂) ₂ 1.2.3 per 100 gms. sat. sol.		Gms. C ₆ H ₃ OH(NO ₂) ₂ 1.2.3 per 100 gms. sat. sol.		Gms. C ₆ H ₃ OH(NO ₂) ₂ 1.2.3 per 100 gms. sat. sol.

DINITRO RESORCINOLS 2.4 and 4.6 $(NO_2)_2C_6H_2(OH)_2$.

Freezing-point data for mixtures of dinitro resorcinols and Styphnic acid are given by Jefremow, 1934.

PICRAMIDE (1.2.4.6 Tri nitraniline) $NH_2C_6H_2(NO_2)_3$.

100 gms. glycol diacetate $(CH_3COO.CH_2CH_2COO.CH_3)$, b. pt. 188° $189^\circ.6$
dissolve 2.4 gms. $(NO_2)_3C_6H_2.NH_2$ at 25° . (Faylor and Blenkinsbach, 1926.)

Freezing-point data are given by Jefremow, 1918, for mixtures of Picramide and each of the following compounds: Anthracene, Acenaphthene, Fluorene, Naphthalene, Phenanthrene, Picric acid and Retene. Results for mixtures of Picramide and Fluoranthene and for Picramide and Pyrene are given by Shinomiya, 1940; Results for Picramide and Tetra nitro methyl aniline are given by Jefremow and Tichomirow, 1928; Results for Tri nitro aniline and naphthalene are given by Grimm, Günther and Titus, 1931.

BROMO BENZENE C_6H_5Br .

100 gms. H_2O dissolve 0.0446 gm. C_6H_5Br at 30° . (Gross and Saylor, 1931.)

Freezing-point data are given for mixtures of Bromo benzene and:

Chloro benzene (Pascal, 1913; Klemm, Klemm and Schiermann, 1933.)

Iodo " " " " " " "

Fluoro " " " " " " "

Benzene (Klemm, Klemm & Schiemann, 1933.)

Nitrogen peroxide (Pascal, 1923.)

Di chloro benzene (Timmermans, 1934.)

o Chloro toluene " "

DIBROM ANILINE 1.2.4 $NH_2C_6H_3Br_2$.

Freezing-point data for mixtures of Dibrom aniline and Picric acid are given by Hertel, 1924.

CHLORO BENZENE C_6H_5Cl .

100 gms. H_2O dissolve 0.0488 gm. C_6H_5Cl at 30° . (Gross and Saylor, 1931.)

SOLUBILITY OF CHLOROBENZENE IN SULPHUR.

"Synthetic Method," see page 292.

(Alexejew.)

t°.	Grams C_6H_5Cl per 100 Grams.	
	Sulphur Layer.	Chlor Benzene Layer.
90	13	70
100	18.5	63
110	27	53
116 crit. temp.	38	

Freezing-point data are given for mixtures of Chloro benzene and:

Acetic acid(1)(2)	Cyano benzene(4)	Fluoro benzene(4)(7)
Benzene(7)	Di bromo ethane(3)	Iodo Benzene(4)(7)
Bromo benzene(4)(7)	Di chloro benzene(6)	Nitro benzene(5)
Chloro toluene(3)(7)	Ethylene bromide(3)	Pyridine(2)

(1) Baud, 1913c; (2) Burnham and Madgin, 1936; (3) Linard, 1925; (4) Pascal, 1913; (5) Hrynakowski and Szmyt, 1938a; (6) Timmermans, 1934; (7) Klemm, Klemm and Schiemann, 1933.

DI CHLOR ANILINE 1.2.4 NH₂C₆H₃Cl₂.

Freezing-point data for mixtures of Dichlor aniline and:

Picric acid	(Hertel, 1924.)
Diphenyl amine	(Giua and Cherchi, 1919.)

CHLORO NITRO ANILINES NH₂C₆H₃Cl(NO₂).

Freezing-points of mixtures of Chloro nitro anilines are given by de Bruyn, 1917.

FLUORO BENZENE C₆H₅F.

100 gms. H₂O dissolve 0.154 gm. C₆H₅F at 30°. (Gross, Saylor and Gorman, 1933.)

Freezing-point data are given for mixtures of Fluoro benzene and:

Benzene(3)	Chloro toluene(2)
Bromo benzene(1)(3)	Dichloro benzene(2)
Chloro benzene(1)(3)	Iodo benzene(3)

(1) Pascal, 1913; (2) Timmermans, 1934; (3) Klemm, Klemm and Schiemann, 1933.)

iodo benzene C₆H₅I.

100 gms. H₂O dissolve 0.034 gm. C₆H₅I at 30°. (Gross, Saylor and Gorman, 1933.)

Freezing-point data are given for mixtures of Iodo benzene and:

Benzene(2)	Chloro benzenes(1)(2)
Bromo benzene(1)(2)	Fluoro benzene(2)

(1) Pascal, 1913; (2) Klemm, Klemm and Schiemann, 1933.

BENZENE DIAZONIUM PHOSPHOR FLUORIDE C₆H₅N₂PF₆.

One liter sat. solution in water contains 0.036 gm. mol C₆H₅N₂PF₆. (Lange and Muller, 1930.)

BROMO PHENOLS C₆H₄OHBr.

Freezing-point data are given for:

q	Bromo phenol + p	Bromo phenol (Holleman and Rinkes, 1911.)
p	"	" + Tetra methyl phthalan (Bennett and Wain, 1926.)

Chloro PHENOLS *o* *m* and *p* $C_6H_4OH.Cl$.

SOLUBILITY OF EACH SEPARATELY IN WATER AND IN BENZENE.

(Sidgwick and Turner, 1922.)

The synthetic method was used at the higher temperatures and the Beckmann freezing-point apparatus at the lower.

RESULTS FOR THE SOLUBILITY IN WATER :

+ Ice = ice present. + C_6H_6 = Benzene present. S = Solid chlorphenol present. L = Second liquid layer present. * Indicates metastable equilibrium.

The critical solution temperature of mixtures of *p*-chloro phenol and benzene is -2.0° (Cottrell, 1928).

Freezing-point data for mixtures of Chloro phenols and:

Acetone (Bramley, 1916.)	Nitrobenzene (Hrynakowski and Szmyt, 1938a.)
Aniline " "	Phenyl hydrazine (Puschin and Dimitryev, 1936.)
Benzylamine (Puschin and Rikovsky, 1937.)	Pyridine (Bramley, 1916.)
Chloro phenol (Holleman and Rinkes, 1911.)	Quinoline " "
Di phenyl methyl amine (Bramley, 1916.)	Toluidine (Burnham and Madgin, 1936.)
Di methyl aniline (Bramley, 1916.)	Picric acid " " " "

The critical solution temperature of mixtures of p chlorophenol and naphthalene is 58.2° (Lecat 1908.)

iodo PHENOL $p\ C_6H_5OI$.

Freezing-point data for mixtures of p and o Iodo phenols are given by Holleman and Rinkes, 1911, and for mixtures of Iodo phenol and Tetra methyl phthalan are given by Bennett and Main, 1916.

NITROSO BENZENE C_6H_5NO .

Freezing-point data are given for:

Nitroso benzene + Acetic acid (Hammick and Illingworth, 1910.)
" " + Aniline (Kreman, 1904.)
" " + Nitro benzene (Jager and Van Kregten, 1912.)
" " + Nitroso toluene (Hammick, Edwards, Illingworth and
" " + Nitroso mesitylene (Small, 1913.)

NITRO BENZENE $C_6H_5NO_2$.

SOLUBILITY OF NITROBENZENE IN WATER.

EQUILIBRIUM IN THE SYSTEM NITROBENZENE, SULFURIC ACID AND WATER.
(Olby, 1932.)

The binodal curves were determined by titrating aqueous sulfuric acid solutions with nitrobenzene to appearance of turbidity. Tie lines were determined by mixing suitable quantities of the three components to yield two layers and titrating each for sulfuric acid. Determinations were made at 0° , 22° and 34° but the temperature coefficient is so small that the points at the three temperatures all fall upon the same curve.

Binodal curve at 22° Tie Lines at 22°

100 gms. sat. solution of nitrobenzene in liquid Sulfur Dioxide contain about 50 gms. $C_6H_5NO_2$ at (?) t° .

100 gms. sat. solution of nitrobenzene in liquid Ammonia contain about 24 (???) gms. $C_6H_5NO_2$ at (?) t° . (De Carli, 1927.)

The critical solution temperature of mixtures of nitrobenzene and hexane is 19° . (Dessart, 1926.)

The critical solution temperature of mixtures of nitrobenzene and 2,5 Dimethyl hexane (Di iso butyl) is 28.2° . (Timmermans and Hennant-Roland, 1932.)

The critical solution temperature of mixtures of nitrobenzene and borneol is at 70° and the mixture contains 59.8 percent $C_6H_5NO_2$. (Lecat, 1930.)

Data for the mutual solubility of nitrobenzene in hexane, decane and American petroleum in the liquid state at pressures up to 1000 atmospheres, are given by Kohnstamm and Timmermans, 1913.

EQUILIBRIUM IN THE SYSTEM NITROBENZENE AND HEXANE.

(Timofeev and Starobinsky, 1926.)

The authors' results were plotted and the following values read from the curve. The freezing-point of nitrobenzene is lowered by hexane to the triple point at which two liquid layers are formed.

Results for the f. pt. curve

Results for the liquid layers

92.8 crit. t.	∞	160	3.75
98.7 crit. t.	...	∞	...	200+	crit. t.	∞	...

* in above table indicates that a solid phase is present.

The above determinations were made by the synthetic method. M. pt. of *o* = 44.9°; of *m* = 95.1°, of *p* = 113.8°. Triple pt. for *o* = 43.5° at conc. 99.48 and 0.35; for *m* = 41.5° at conc. 74 and 3.16; for *p* = 39.6° at conc. 71.2 and 3.26.

One liter sat. solution in water contains 3.89 gms. *o* nitrophenol at 48°.

One liter sat. solution in 1.0 *n* $C_6H_4(ONa)NO_2$ contains 9.6 gms. *o* nitrophenol at 48°. (Sidgwick, '10.)

100 gms. H_2O dissolve 0.804 gm. *p* $C_6H_4OHNO_2$ at 15° and 6.052 gms. at 50°. (Desvergues, 1927.)

100 gms. sat. solution in water contain 0.208 gm. *o* nitrophenol at 20°.

" " " " 2.14 gms. *m* " " " " 1.32 " *p* " " " (Vaubel, 1895.)

F.-pt. data for mixtures of *m* nitrophenol and water and for *p* nitrophenol and water are given by Bogojawlewsky, Winogradow, and Bogolubow (1906).

SOLUBILITY OF *m* NITROPHENOL AND OF *p* NITROPHENOL IN AQUEOUS SOLUTIONS OF HYDROCHLORIC ACID AT 25°. (Knox and Richards, 1919.)

SOLUBILITY OF ORTHO NITROPHENOL IN AQUEOUS SOLUTIONS OF METHYL ALCOHOL.
(Duff, 1929.)

NOTE.—In cases where a second liquid layer did not separate the saturated solution was analyzed by evaporation to dryness and weighing the residue. The method used in the cases of formation of liquid was to gradually add nitrophenol to weighed amounts of solvent until a trace just remained undissolved and calculate the solubility from the increase in weight. If an oily layer began to separate the addition of the solid was continued until an excess was present and the solubility again calculated from the increase in weight of the mixture.

SOLUBILITY OF *o*, *m* and *p* NITROPHENOL, EACH SEPARATELY, IN SEVERAL ORGANIC SOLVENTS. (Garrick, 1921.)

Since saturation is reached very quickly with these compounds the determinations were made by adding to a carefully weighed glass stoppered flask, an accurately weighed amount of the solid and then a small amount of the solvent. The mixture was warmed slowly, while being constantly agitated, until the solid just disappeared. The temperature was observed and the amount of solvent present determined by carefully weighing the flask. Succeeding determinations were made in exactly the same manner after adding additional amounts of the solvent.

The partial vapor pressures at 30° of aqueous solutions of benzene are given by Saylor, Stuckey and Gross, 1938.

SOLUBILITY OF BENZENE VAPOR IN WATER AT 25°. (Milligan, 1925.)

A mixture of air and benzene vapor of known composition was shaken with water at 25° and the residual mixture analyzed by means of a Haldane gas analysis apparatus. The amount of benzene vapor dissolved was thus found by difference. The coefficient of solubility (volume of gas, reduced to 0°, which dissolves in one volume of water at 25°, when the pressure of the gas over the water is 760 mm.) was found to be $\alpha_{25} = 1.5$.

From this value it was calculated that approximately 0.07 cc. of liquid benzene is dissolved by 100 cc. of H_2O at 25° .

SOLUBILITY OF BENZENE IN SUPER-HEATED WATER. (Jaeger, 1923.)

The determinations were made in a large shaking autoclave. Mixtures of 500 cc. of benzene and 2 liters of water were shaken 10 minutes at each temperature, and then allowed to stand 20 minutes, 500 cc. of the solution was withdrawn and allowed to stand a day. The volume of separated oil was then carefully determined.

	t°.....	100°.	150°.	200°.	250°.	284°.	300°.
cc. C ₆ H ₆ dissolved per 100 cc. H ₂ O.....		0.2	0.6	2.1	7.3	10.6	14.6

The following values were obtained for :

Solvent Benzol (b. pt. 140°-190°).				Pure Benzin from Petroleum (b. pt. 68°-100°).			
t°	150°.	200°.	25°.	t°	150°.	200°.	250°.

<p>100 gms. Aq. 0.4 g Sodium Oleate Solution (= 10.8 gm. Na Oleate per 100 gms. solution) dissolve 4.0 gms. C₆H₆ directly and 11.9 gms. by mixing benzene and oleic acid and adding the calculated amount of H₂O.</p>							

THE SYSTEM BENZENE, PHENOL AND WATER AT 25°.

(Horiba, 1914.)

In the case of phenol, the bromine method was used for its determination. In the case of the other two compounds, the amounts required to produce constant turbidity were measured directly from burettes.

Solubility of Benzene in Aqueous Solutions Containing Phenol and Vice Versa.

d_{25}^4	Gms. per 100 Gms. $C_6H_5OH + C_6H_6 + H_2O$		Saturating Phase.

0.8818	4.78	94.98	"
0.8764	0	99.95	"

Data are also given for the solubility of phenol as solid phase, in C_6H_6 and in water and in their mixtures. A complete table for the conjugate points, showing the distribution of phenol between the aqueous and the benzene layers, is given. The results agree with those of Rothmund and Wilsmore. See page 385.

The surface tension, density, viscosity and index of refraction of various mixtures of benzene phenol and water whose compositions fall within the completely miscible part of the system, are given by Wiedman and Swearington, 1931.

The following values in substantial accord with those of Horiba, 1914 are by Vondracek and Dostal, 1936. These authors used the synthetic method and from the observed temperatures of appearance of opalescence of known mixtures, values for given temperatures were obtained by graphical interpolation.

Results at 20°

Results are also given for the distribution of p chloro aniline between aqueous potassium chloride and bromide solutions and heptane.

PHENOL C₆H₅OH.

FREEZING-POINTS OF MIXTURES OF PHENOL AND WATER. (Rhodes and Markley, 1921.)

Carefully purified natural phenol was used. To weighed amounts in test tubes of 20 × 3.2 cm., weighed amounts of H₂O were added and the mixtures slowly cooled while being stirred. Near the estimated f. pt. the mixture was seeded by adding a small crystal of solid phenol or of phenol hydrate. The highest temperature at which permanent crystals could be obtained was taken as the f. pt. of the mixture.

Additional data on this system are also given by Bailey, 1925.

PHENOL

REMARKS ON THE EXPERIMENTS OF RHODES AND MARKLEY (previous page).

Phenol forms a definite hydrate, $2C_6H_5OH \cdot H_2O$ melting at 150.9 and forming eutectics with anhydrous phenol and with ice, respectively. Because of the tendency towards suspended transformation, the solid phase which ordinarily appears when a mixture of water and phenol is cooled, is the metastable anhydrous phenol. Hydrated crystals were obtained only by seeding with hydrate or by cooling to very low temperatures. Hydrated crystals were originally obtained by cooling a solution of 15 per cent H_2O in phenol for 1 hour to a temperature of -78° . These were used for seeding in order to obtain points on the stable curve. This method avoided supercooling and suspended transformation.

(Approximate data for the f. pt. of mixtures of phenol and water are given by Hoffert, 1922.)

MUTUAL SOLUBILITY OF PHENOL AND WATER. (Hill and Malisoff, 1926.)

Highly purified materials were used. The m. pt. of the phenol was 40.92 ± 0.01 . The two bulb solubility flasks described in *J. Am. Chem. Soc.*, 45, 1143 (1923) were used. At higher temperatures up to the consolute point 66° , the plethostatic method of Alexejeff was used.

According to Bailey, 1925 the two liquid layers are in contact with solid phenol at 10.7 and contain respectively 7.6 and 75 wt per cent C_6H_5OH . The critical solution temperature is 65.3° and the corresponding phenol content, 36.5 per cent.

A few determinations for the above system are given by Dubrisay, Tripier and Toquet, 1918, 1919.

Several determinations of the mutual solubility of phenol and water at temperatures between $66^\circ.2$ and $71^\circ.1$ and at pressures up to 1000 kilograms are given by Timmesmans, 1922.

The temperature of clouding of various mixtures of phenol and aqueous solutions of sodium hydroxide, barium hydroxide, calcium hydroxide, sulfuric acid, hydrochloric acid, sodium sulfate and sodium chloride were determined by Dubrisay, 1921, 1922, and by Dubrisay, Tripier and Toquet, 1918, 1919. The presence of acids, bases and salts was shown to modify considerably the miscibility of liquid pairs. In general, various mixtures of 0.1 normal aqueous solutions were added to equal volumes of phenol (treated with just enough water to cause it to remain liquid at ordinary temperature) and the temperature of clouding determined. This method was applied to the study of reactions such as the saturation of acids by bases, formation of double sulfates and in general, physical chemical volumetry.

The miscibility of phenol and water as influenced by a third substance, such as azobenzene, anthraquinone, naphthalene, naphthylamine and salol was studied by Boutaric and Nabot, 1923. The results are given in terms of the ratio of the elevation of temperature produced by the addition of the third substance to given mixtures of phenol and water.

PHENOL C₆H₅OH.

SOLUBILITY OF PHENOL IN WATER.

(Alexejew, 1886; Schreinemaker, 1909; Rothmund, 1908.)

The determinations were made by the "Synthetic Method," for which, see Note, p. 292.

t°.	Gms. Phenol per 100 Gms.	
	Aqueous Layer.	Phenol Layer.
10	7.5	75
20	8.3	72.1
30	8.8	69.8
40	9.6	66.9
50	12	62.7
55	14.1	59.5
60	16.7	55.4
65	21.9	49.2
68.3 (crit. temp.)	33.4	

Results confirming the above, and also viscosity measurements, are given by Scarpa (1904).

The complete $T - x$ data for the system are given by Smith and Maarse (1911).

F.-pt. data for the system are given by Rózsa (1911) and Paterno and Ampola (1897).

Vaubel (1895) states that 100 gms. sat. aqueous solution contain 6.1 gms. phenol at 20°. Sp. Gr. of solution = 1.0057.

The following more recent determinations of the complete $T - x$ diagram of the system are given by Campbell and Campbell, 1937. These authors determined the composition of the two layers at temperatures up to 60° by the refractometric method and do not claim an accuracy equal to the results of Hill and Malisoff, 1926.

				21.9	—	91.4	"

These authors also give results for the refractive indices, surface tensions, viscosities, vapor pressures and composition of the vapor phases of the phenol-water system. They also give similar results for the system phenol - 4% aqueous succinic acid.

Additional results for the mutual solubility of Phenol and Water are given by Dolique, 1932 and by Smith, 1931.

The densities of a series of aqueous phenol solutions over the whole range of miscibility at temperatures between 20° and 70° are given by Howell, 1932.

Results showing the influence of various salts upon the Solubility of Water in Phenol at 18° are given by Cernatescu and Papafil, 1927, and Cernatescu, 1928.

The effect of various concentrations of several potassium salts and of malonic and succinic acids upon the solution temperature (65.6°) of an aqueous phenol mixture containing 36 wt. % C_6H_5OH is reported by Culbertson and Palmer, 1931.

Ferguson, 1927, found that the consolute temperature of the system phenol-water was raised from 65.75° to 68.4° by 0.85% q cresol and from 65.75° to 66.5° by 0.8% quinone.

Results for the effect of various concentrations of $HgCl_2$, $CuCl$ and HCl upon the critical solution temperature of the system phenol + water are given by Carter and Megson, 1927.

Results for the effect of increasing amounts of ammonium, potassium and sodium salts upon the temperature of solution of 36.1 percent phenol in water are given by Duckett and Patterson, 1925.

EQUILIBRIUM IN THE SYSTEM PHENOL AND WATER AT TEMPERATURES BELOW 13° . (Jones, 1927.)

The determinations were made to clear up the uncertainties in regard to the hydrate of phenol and the eutectic points of the system.

SOLUBILITY OF PHENOL AT ROOM TEMPERATURE IN ORDINARY WATER AND IN HEAVY WATER. (Nachod, 1938.)

An excess of phenol was shaken with ordinary water and with heavy water and the milky emulsions subjected to centrifugation.

100 gms. sat. solution in ordinary water contained 8.2 gms. C_6H_5OH .

100 gms. sat. solution in heavy water contained 6.2 gms. C_6H_5OH .

The critical solution temperature of a 35.2 percent solution of phenol in ordinary water (H_2O) is 66.45° .

The critical solution temperature of a 35.0 percent solution of phenol in heavy water (D_2O) is 78.7° . (Timmermans and Poppe, 1935.)

The following results for the change in the critical solution temperature of the system Phenol-Water caused by increasing percentages of heavy water (D₂O) are given by Hall, Wentzel and Smith, 1934.

Percent D ₂ O in D ₂ O + H ₂ O mixture	Critical Solution Temperature
3.89	66.93
5.81	67.21
10.62	67.74
47.20	72.08

Data for this system are also given by Rózsa (1911).

The coefficient of distribution of phenol between olive oil and water at 25°, conc. in oil ÷ conc. in H_2O , is given by Boeseken and Waterman (1911) as greater than 9 and less than 10.3. The figure was obtained by dividing the solubility of phenol in olive oil by the solubility in water, each being determined separately. Results for this system are also given by Reichel (1909).

According to Greenish and Smith (1903), 100 cc. of olive oil dissolve about 50 gms. of phenol at 15.5°. These authors report that 100 cc. of glycerol dissolve about 300 gms. of phenol at 15.5°.

MISCIBILITY OF AQUEOUS ALKALINE SOLUTIONS OF PHENOL WITH SEVERAL ORGANIC COMPOUNDS INSOLUBLE IN WATER.

(Scheuble, 1907.)

To 5 cc. portions of aq. KOH solution (250 gms. per liter) were added the given amounts of the aq. insoluble compound from a buret and then the phenol, dropwise, until solution occurred. Temperature not stated.

EQUILIBRIUM IN THE SYSTEM WATER, PHENOL AND :
(Hardlake, 1915, 1926.)

Ortho Nitro Phenol.

Maximum temp. of complete miscibility.	Gms. $oC_6H_4(OH).NO_2$ per 100 gms C_6H_5OH .
66.45	0.0
69.35	0.87
69.6	0.95
72.15	1.70
76.8	3.04

Para Nitro Phenol.

Maximum temp. of complete miscibility.	Gms. $pC_6H_4(OH).NO_2$ per 100 gms. C_6H_5OH .
66.4	0.0
66.55	0.12
66.8	3.65
67.2	7.71

Maximum temp. of complete miscibility	Gms. $pC_6H_4(OH).NO_2$ per 100 gms. C_6H_5OH .
68.3	17.38
69.95	11.74
71.65	47.4
74.5	79.6

The method consisted in adding the amount of water to the several mixtures necessary to give the maximum temperature of complete miscibility.

EQUILIBRIUM IN THE SYSTEM PHENOL, PYROCATECHOL AND WATER.
(Leone and Angelescu, 1922.)

Synthetic mixtures of weighed amounts of the three components were made and the temperatures of clearing and of clouding of each were determined. The mixtures were prepared either by adding increasing amounts of phenol to definite amounts

EQUILIBRIUM IN THE SYSTEM PHENOL, PYROCATECHOL AND WATER (CON).

The preceding results by Leone and Angelescu are presented in part by Angelescu, 1928, in connection with the system phenol, resorcinol and water.

EQUILIBRIUM IN THE SYSTEM PHENOL, SALICYLIC ACID AND WATER.

(Bailey, 1925.)

The synthetic method was employed. Varying amounts of salicylic acid were added to known mixtures of phenol and water and placed in sealed tubes. The temperature of *sudden thickening* was determined. This point was considered as a more accurate indication of the saturation temperature than the mean between the temperature of clouding and clearing. This was found especially true at the higher temperatures. No compounds or mixed crystals were found at any temperature.

THE BINARY AND TERNARY EQUILIBRIUM END POINTS ARE AS FOLLOWS :

Gms. per 100 gms. of mixture.				Solid Phase.	
t°.	C_6H_5OH .	$C_6H_4OH.COOH(o)$.	H_2O .

EQUILIBRIUM IN THE SYSTEM PHENOL, SALICYLIC ACID AND WATER
(Bailey, 1925.)

The following data for the binodal curves were obtained by the synthetic method. The author determined for each mixture the temperature of the beginning of critical opalescence (C. op.) and the critical solution temperature (C.S.T.). S = gms. C₆H₄OH.CO OH (α) per 100 gms. sat. solution.

estable points.

SOLUBILITY OF PHENOL IN LIQUID PARAFFIN.

A series of mixtures of phenol and liquid paraffin were prepared by rubbing and warming. They were then kept at 15° for 24 hours. A small amount of phenol separated from the mixture containing 2.0 per cent C₆H₅OH but none from that containing 1.0 per cent. The solubility of phenol in liquid paraffin was, therefore, considered to be between 1 and 2 per cent at 15°.

(Gofman-Nicuresci, 1922.)

EQUILIBRIUM IN THE SYSTEM PHENOL, THYMOL AND WATER.
(Wilcox and Bailey, 1929.)

The synthetic method was used and from the curves plotted from the results the values for the following isotherms were obtained.

t°	Gms. per 100 gms. homogeneous mixture		t°	Gms. per 100 gms. homogeneous mixture		t°	Gms. per 100 gms. homogeneous mixture	
	C_6H_5OH	$C_{10}H_{13}OH$		C_6H_5OH	$C_{10}H_{13}OH$		C_6H_5OH	$C_{10}H_{13}OH$

x.1 = $C_{10}H_{16}O.C_6H_5OH$.

Data for the above system obtained by the method of determination of the temperature of disappearance of the last crystal, are given by Kremann, Wischo and Paul (1915). The results are not in good agreement with the above. These authors also give similar determinations for the systems camphor + resorcinol and camphor + β naphthol.

Data for the systems camphor + phenol + water, camphor + *n* butyric acid + water, camphor + succinic acid nitrile + water and camphor + triethylamine + water are given by Timmermans, 1907.

SOLUBILITY OF PHENOL IN BENZENE AND IN PARAFFIN.

(Schweissinger, 1884-85.)

Solvent.	Gms. C_6H_5OH per 100 Gms. Solvent at:			
	16°.	21°.	25°.	43°.
Paraffin	1.66	5
Benzene	2.5	8.33	10	100

Data for equilibrium in systems composed of phenol, water and each of the following compounds are given by Timmermans (1907): NaCl, KCl, KBr, KNO_3 , K_2SO_4 , $MgSO_4$, tartaric acid, salicylic acid, succinic acid and sodium oleate,

The critical solution temperature of mixtures of phenol and iso amyl butyrate is about 7°. (Lecat, 1927.)

100 gms. sat. solution of phenol in liquid sulfur dioxide contain 28 gms. C_6H_5OH at t°(?). (De Carli, 1927.)

NITROSO ANILINE $p\text{-NO}_2\text{C}_6\text{H}_4\text{NH}_2$.

Freezing-point data for mixture of *p* nitroso aniline and *p* nitraniline are given by Jaeger and van Kregten, 1912.

PYROCATECHOL $\alpha\text{-C}_6\text{H}_4(\text{OH})_2$.

SOLUBILITY OF PYROCATECHOL IN WATER AND IN OTHER SOLVENTS.
(Walker, Collett and Lazell, 1931.)

The determinations were made by the synthetic method. In order to prevent oxidation the air in the sealed bulbs was replaced by hydrogen. The determinations were plotted and the following values obtained from the curves.

t°	Gm. Mols. $\alpha\text{-C}_6\text{H}_4(\text{OH})_2$ per 100 gm. mols. sat. solution in:						
	Water	Ethyl Alcohol	Ethyl Ether	Acetone	Carbon Tetrachloride	Chloroform	Benzene

DISTRIBUTION OF RESORCINOL BETWEEN WATER AND ORGANIC SOLVENTS AT ORDINARY TEMPERATURE.

(Vaubel — J. pr. Ch. [2] 67, 478, '03.)

Gms. C ₆ H ₄ (OH) ₂ Used.	Solvents.	Gms. C ₆ H ₄ (OH) in	
		H ₂ O Layer.	Organic Solvent Layer
1.191	60 cc. H ₂ O + 30 cc. Ether	0.2014	0.0806
1.191	60 cc. H ₂ O + 60 cc. Ether	0.2475	0.0525
0.800	40 cc. H ₂ O + 40 cc. Benzene	0.5873	0.2127
0.800	40 cc. H ₂ O + 80 cc. Benzene	0.5773	0.2227
0.500	50 cc. H ₂ O + 50 cc. CCl ₄	0.4885	0.0115
0.500	50 cc. H ₂ O + 100 cc. CCl ₄	0.4880	0.0120
0.500	50 cc. H ₂ O + 150 cc. CCl ₄	0.4880	0.0120

The coefficient of distribution of resorcinol at 25° between olive oil and water (conc. in oil ÷ conc. in H₂O) is given as 0.04 by Boeseken and Waterman (1911, 1912).

HYDROQUINONE p C₆H₄(OH)₂.

SOLUBILITY OF HYDROQUINONE IN WATER AND IN OTHER SOLVENTS.

(Walker, Collett and Lazzell, 1931.)

The determinations were made by the synthetic method. In order to prevent oxidation the air in the sealed bulbs was replaced by hydrogen. The determinations were plotted and the following values obtained from the curves.

t°	Gm. Mols. p C ₆ H ₄ (OH) ₂ per 100 gms. mols. sat. solution in:					
	Water	Ethyl Alcohol	Ethyl Ether	Acetone	Carbon Tetrachloride	Benzene
20	1.16	17.25	—	11.30	—	0.02

100 gms. sat. solution in water contain 6.7 gms. hydroquinol at 20°, Sp. Gr. of sol. = 1.012. (Vaubel, 1899.)

100 gms. 95% formic acid dissolve 6.07 gms. hydroquinol at 20.2°. (Aschan, 1913.)

SOLUBILITY OF HYDROQUINOL IN AQUEOUS SOLUTIONS OF SALTS AT 18°.

(Linderstrom-Lang, 1924.)

Due to the instability of hydroquinol at low hydrogen ion concentrations all the determinations were made in presence of 0.01 *n* hydrochloric acid. Hence in each case the solvent is composed of 0.01 *n* HCl containing the stated gram equivalents per liter (normality *n*) of the several salts.

EQUILIBRIUM IN THE SYSTEM HYDROQUINOL, PHENOL AND WATER
(Leone and Angelescu, 1922.)

Synthetic mixtures of weighed amounts of the three components were made and the temperatures of clearing and of clouding of each were determined. Different amounts of phenol were first added to known concentrations of aqueous hydroquinol and then different amounts of hydroquinol were added to known concentrations of aqueous phenol solutions.

Aq. 1.02 % $C_6H_4(OH)_2$.		Aq. 4.77 % $C_6H_4(OH)_2$.		Aq. 9.16 % $C_6H_4(OH)_2$.

100 gms. H₂O dissolve 0.147 gm. o C₆H₄NH₂NO₂ at 30°. (Gross, Saylor and
 " " " 0.121 " m " " Gorman, 1933.)
 " " " 0.0728 " p " " (Gross and Saylor, 1931)

SOLUBILITY OF META NITRANILINE IN WATER.

(Walton and Finzel, 1928.)

Large volumes of water were saturated with m nitraniline at 15° - 20° above the temperature of the determinations and cooled to the desired temperature. A miniature Gooch asbestos filter was used to remove the finely suspended solid from the saturated solution. The authors found that saturation was reached quite slowly. The solutions were analyzed by the titanium tri chloride method and the sodium nitrite method.

SOLUBILITY OF *o*, *m* AND OF *p* NITRANILINES IN WATER.
(Sidgwick and Rubie, 1921.)

The Synthetic method was used. Both the triple points and the critical solution temperatures, for the two liquid layers which separate, were determined. Asterisks indicate that a solid phase is present.

Oxymethyl FURFURAL $C_6H_6O_3$.FREEZING-POINTS OF MIXTURES OF OXYMETHYL FURFURAL AND WATER.
(Miklandorp, 1919.)

The compound was shown to have the structural formula $H(O).H_2C - \overset{\overset{H}{\parallel}}{C} - \overset{\overset{H}{\parallel}}{C} - C.OH$.

It distills at 114-116°, at 1 mm. pressure, yielding a liquid of $d_{15}^{15} = 1.268$. At very low temperatures it yields crystals of m. pt. 31°5. It is soluble in all proportions in water. The following results for the f. pts. of its mixtures with water were obtained.

t° of f. pt.	Mol. per cent $C_6H_6O_3$ in mixture.	t° of f. pt.	Mol. per cent $C_6H_6O_3$ in mixture	t° of f. pt.	Mol. per cent $C_6H_6O_3$ in mixture.

3	" 4 "	$C_6H_3NH_2(1)(3)SO_3H(4)$	0.194

ACONITIC ACID $C_6H_5(COOH)_2$.

100 grams of formic acid (95% $HCOOH$) dissolve 2.01 grams $C_6H_5(COOH)_2$ at 20.6° C. (Aschan, 1911)

ALLOXANTIN $C_6H_4O_8N_4 \cdot 2H_2O$.

SOLUBILITY IN WATER AND IN AQUEOUS SOLUTIONS OF ALLOXAN AT 25° (Billmann and Bentzen 1918)

Oxygen was excluded during the determinations by the use of CO_2 . Aqueous solutions rotated from 3.8 to 5.5 hours gave practically identical results. The solutions were analyzed by estimations of total nitrogen and alloxantin nitrogen determined colorimetrically. The solubility of alloxantin in water at 25° was found to be 0.2885 gms. $C_6H_4O_8N_4 \cdot 2H_2O$ per 100 gms. sat. solution. The solubility in aqueous solutions of alloxan was as follows.

Grams per 100 grams sat. solution.		Gm. mols. sat. l. per 100 gms. sat. sol.	
Alloxan nitrogen.	Alloxantin nitrogen.	Alloxan.	Alloxantin
0.0023	0.0387	0.82	8.63

ANILINE $C_6H_5(NH_2)$.

SOLUBILITY IN WATER AT 22°.

(Hetz, 1898; see also Vautel, 1895; Aignan and Dugas, 1899)

100 cc. H_2O dissolve 3.481 cc. $C_6H_5(NH_2)$ -- Vol. of Sol. = 103.48, Sp. Gr. = 0.9986.

100 cc. $C_6H_5(NH_2)$ dissolve 5.22 cc. H_2O -- Vol. of Sol. = 104.96, Sp. Gr. = 1.0175.

100 cc. sat. aq. sol. contain 3.607 gms. $C_6H_5NH_2$ at 25°. (Riedel, 1906.)

SOLUBILITY OF ANILINE IN WATER DETERMINED BY THE SYNTHETIC METHOD.

(Sidgwick, Pickford and Willden, 1911.)

t°	Gms. $C_6H_5NH_2$ per 100 gms. aq. layer		t°	Gms. $C_6H_5NH_2$ per 100 gms. aq. layer

100 gms. sat. sol. of Aniline in water contain 3.66 gms. $C_6H_5NH_2$ at 25° .
 " " " " " Water in aniline " 5.22 " H_2O at 25° .
 (Hill and Macy, 1924.)

Determinations of the densities of each of the two layers formed by mixtures of aniline and water between 20° and 100° are given in the form of a diagram by Mondain-Monval and Schlegel, 1933. The two curves cross at 77° and below this temperature the aniline rich layer is the lower and above the aniline rich layer is the upper. At 77° the two layers have the same density.

RECIPROCAL SOLUBILITY OF ANILINE AND WATER DETERMINED BY THE FREEZING-POINT METHOD.

(Average curve from the results of Hill and Macy, 1924, and Appley and Davies, 1925.)

(Average of results from the results of Hunt and Macy, 1924, and Appleby and Davies, 1925.)

Determinations of the solubility of aniline in saturated aqueous solutions of sodium benzene sulfonate, sodium xylene sulfonate and sodium cymene sulfonate at various temperatures are given by Hauslick, 1935.

100 gms. aq. 0.4 normal sodium Oleate solution (= 10.8 gm. Na oleate per 100 gms. solution) dissolve 11.5 gms. $C_6H_5NH_2$ at 20° . (Smith, 1932.)

SOLUBILITY OF ANILINE IN AQUEOUS SOLUTIONS OF SALTS.

(Glasstone, Bridgeman and Halsey, 1927.)

The authors' original results are in terms of gm. solub. of salt and of water required to yield a homogeneous mixture with 1 gm. mol. of aniline. The following weight percentage values are those recalculated for the Landolt and Bornstein Tabellen.

t°	Salt	Gms. per 100 gms. sat. sol. Salt	C ₆ H ₅ NH ₂	t°	Salt	Gms. per 100 gms. sat. sol. Salt	C ₆ H ₅ NH ₂

SOLUBILITY OF ANILINE IN AQUEOUS SOLUTIONS OF ANILINE HYDROCHLORIDE.
(Sidgwick, Pickford and Wilsden, 1911.)

The temperatures at which a second liquid phase separated from homogeneous mixtures of known amounts of aniline + HCl + H₂O were determined for a very extensive series of mixtures. The procedure consisted in first heating a given mixture until it became homogeneous and then cooling it slowly, with constant shaking. A critical turbidity preceding the actual separation by a few degrees was always noticed. The point of separation was taken as that at which a small gas flame seen through the liquid disappeared. At higher temperatures, the observations were made on mixtures contained in sealed bulbs. In the actual experiments, binodal curves for mixtures of Aq. HCl (of different strengths) and aniline were determined. By interpolation from these, the following isothermal curves were obtained.

In order to determine which of the above mixtures represent the upper and lower layers in contact with each other, a series of determinations of the distribution of acetic acid between water and aniline was needed. The results of these determinations at 20°, are as follows :

Gms. CH₃COOH per 100 gms.

H ₂ O layer (C ₁).	C ₆ H ₅ NH ₂ layer (C ₂).	C ₂ C ₁ .
1.68	0.65	2.58

8.77	6.22	1.41
9.63	7.25	1.33
11.19	9.30	1.20

The authors next determined the temperatures at which two layers are formed in solutions containing constant concentrations of acetic acid and variable percentages of water and aniline. For this purpose mixtures of aniline and acetic acid and of water and acetic acid, containing in both cases the same weight per cent of acetic acid, were prepared. Variable mixtures of these two solutions yield in every case a ternary mixture containing a constant concentration of acetic acid. On gradually changing the temperature of such ternary mixtures, containing respectively 15.83, 16.25 and 16.56 per cent of CH₃COOH, an upper and a lower point was found at which clouding occurs. Thus for these ranges of concentration the systems yield closed curves of solubility having an upper and a lower critical temperature of solution.

Butyl " "	-108.2	156.8	0.7887	136.15	51.1	42.5
Cyclo hexane	+ 6.55	80.77 (80.8)	0.7830 (d ₂₀ 0.7967)	84.036	30.8 (31.0)	40.0
Methyl cyclohexane	-147.5	100.5 (100.4)	0.7603 (d ₂₀ 0.798)	98.112	41.0 (41.0)	40.0
Hexane	-94.65	69.0 (69.0)	0.6780 (0.6638)	86.112	69.2 (69.0)	41.0
Methyl 3 pentane	—	63.2	0.6687	—	60.6	41.0
Isohexane	-137.1	60.18 (61.7-62.4)	0.6580 (0.658)	—	74.9 (74.8)	37.5
Trimethyl ethyl methane . .	-98.2	19.70	0.6538	—	80.65	40.0

The results given in parentheses in the above table are those of Chavanne and Simon, 1919 and 1920. These authors also give for mixtures containing aniline the following additional critical solution temperatures. Isopentane (b. p. 27°-29°; $d_{15} = 0.6394$) 77°; Pentane (b. p. 35°-36°; $d_{15} 0.6154$) 72°; Isoheptane (b. p. 90-91°; $d_{15} = 0.6842$) 72°-8; Heptane (b. pt. 98°-98°; $d_{15} = 0.6879$) 70°; Isooctane (b. p. 116°) 74°; Octane (b. p. 125.8°; $d_{15} = 0.7063$) 72°; Dimethylcyclopentane (b. p. 91°-94°) 45°; Dimethylcyclohexane (b. pt. 121.2°-121.8°; $d_{15} = 0.775$) 49°.

Van Rysselberge, gives 72° as the C. S. T. of Aniline + Dimethyl 1,2 Cyclopentane.

RECIPROCAL SOLUBILITY OF ANILINE AND HYDROCARBONS. (Tizard and Marshall, 1921.)

The authors desired a method for the determination of aromatic hydrocarbons in certain mixtures. For this purpose they made a long series of experiments showing the effect of the addition of various aromatic hydrocarbons, upon the temperature of clouding of mixtures of equal volumes of aniline and a sample of "petrol", free of aromatic hydrocarbons. The results are presented, for the most part, in the form of curves.

THE FREEZING-POINTS OF ANILINE CONTAINING SMALL AMOUNTS OF IMPURITIES. (Sanderson and Jones, 1920.)

Mixtures of pure dry aniline and the several compounds, each carefully purified and dried, were prepared and their freezing-points determined. The table shows the percentage by weight of aniline in the mixture and the corresponding freezing-point.

Wt. percent of Aniline.	Freezing-point of the dry binary mixture of aniline with

ANILINE CHLOROSTANNATE (C₆H₅NH₂)₂.H₂SnCl₆.100 cc. H₂O dissolve about 28.0 gms. aniline chlorostannate at 16° (Druce, 1918.)**Methyl PYRIDINES (Picolines)** CH₃C₅H₄N.

Data for the reciprocal solubility of 3 methyl pyridine (= β picoline) and water, 2,6 dimethyl pyridine (= 2,6 lutidine) and water, methyl pyridine (= γ picoline) zinc chloride and water, methyl pyridine zinc chloride and each of the following alcohols; methyl, ethyl, propyl, isobutyl, isoamyl, cetyl and methyl hexylcarbinol, determined by the synthetic method (see Note, p292), are given by Flaschner (1909). See also p.616 for 2,4,6 trimethyl pyridine (collidine) and water.

1000 cc. H₂O dissolve 65.3 gms. α Picoline Helianthate at 20°-25°

Amino PHENOLS *o*, *m* and *p* C₆H₄.OH.NH₂.

SOLUBILITY OF EACH SEPARATELY IN WATER AND IN BENZENE.
(Sidgwick and Gallow, 1924.)

The determinations were made by the sealed tube method. In the case of meta amino phenol it was difficult to avoid supersaturation. By proper care the two-liquid curve (L) lying some 60° below the stable solid curve (S) and even the meta stable ice curve in dilute solution, could be determined.

AMINO PHENOLS

Freezing-point data are given for mixtures of *o*-, *m*- and *p*-Amino phenols by Hrynakowski and Szymt, 1936. Results are given for mixtures of amino phenols and each of the following compounds.

Aniline (Kremann and Hohl, 1920.)
 Anthracene (Bernoulli and Lotta, 1933.)
 Antipyrine (Pfeiffer and Seydel, 1928b.)
 Cineole (Bellucci and Grassi, 1913.)
 Dinitro benzenes (Kremann, Lupfer and Zawodsky, 1920.)
 Hydroquinone (Kremann and Lupfer, 1920.)
 Naphthalene (Bernoulli and Lotta, 1933.)
 Naphthols (Kremann, Lupfer and Zawodsky, 1920.)
 Naphthylamines (Kremann and Hohl, 1920.)
 Nitro phenols (Kremann, Lupfer and Zawodsky, 1920.)
 Phenanthrene (Bernoulli and Lotta, 1933.)
 Phenol (Kremann, Lupfer and Zawodsky, 1920.)
 Phenylene diamine (Kremann and Hohl, 1920.)
 Pyramidon (Pfeiffer and Seydel, 1928b.)
 Pyrocatechol (Kremann, Lupfer and Zawodsky, 1920.)
 Pyrogallol (" " " ")
 Resorcinol (" " " ")
 Sarcosine anhydride (Pfeiffer and Seydel, 1928.)
 Toluidine (Kremann and Hohl, 1920.)

ANILINE SULFONIC ACIDS, *o* and *m* C₆H₄(NH₂)₁SO₃H.

PHENYLENE DIAMINES *o*, *m* and *p* $C_6H_4(NH_2)_2$.

SOLUBILITY OF EACH SEPARATELY IN WATER. (Sidgwick and Neill, 1923.)

The determinations were made by the synthetic method.

m phenylene diamine was found to be dimorphic. The two forms are enantiotropic with a transition point at 36°. The α form (stable above 36°) consists of brown needles, the β form (stable below 36°) of mauve plates

D MANNITOL HEXANITRATE $C_6H_8(NO_3)_6$.

Freezing-point data are given by Urbanski, 1933, 1934, for mixtures of D Mannitol hexanitrate and each of the following compounds:

Diethyl diphenyl urea	Naphthalene	Nitro erythritol
Dimethyl diphenyl urea	Nitro aniline	Nitro naphthalene
Dinitro anisole	Nitro anisole	Nitro penta erythritol
Dinitro benzene	Nitro benzaldehyde	Nitro phenetol
Dinitro chloro benzene	Nitro benzoic acid	Nitro phenol
Dinitro toluene	ethyl ester	Nitro toluene
Hydroquinone dimethyl ether	Nitro chloro benzene	Trinitro benzene
		Trinitro toluene

ETHYL SUCCINIMIDE $(CH_2CO)_2NC_2H_5$.

Freezing-point data for mixtures of ethyl succinimide and bromo toluene and of ethyl succinimide and p xylene are given by Paterno and Ampola, 1897.)

METHYL CYCLOPENTANE $C_5H_8 \cdot CH_3$.

The critical solution temperature of mixtures of methyl cyclopentane and sulfur dioxide is 8° and the reciprocal solubility curve at this temperature is practically flat between the concentrations 45 and 90 gm. mol. percent SO_2 . (Leslie, 1934.)

DI ALLYL ETHER $(C_3H_5)_2O$.

RECIPROCAL SOLUBILITY OF DI ALLYL ETHER AND WATER.
(Bennett and Phlip, 1928.)

The determinations were made by the method of Hill, 1923, modified by reducing the scale of the apparatus to require only 4-5cc of each liquid, and adding a globule of Hg to hasten mixing.

t°	Wt. % $(C_3H_5)_2O$ in Aq. Phase	Wt. % H_2O in Ether phase	t°	Wt. % $(C_3H_5)_2O$ in Aq. Phase	Wt. % H_2O in Ether phase

CYCLOHEXANONE (CH₂)₅:CO.

Freezing-point data for mixtures of cyclohexanone and phenol are given by Schmidlin and Lang, 1910.

SARCOSINE ANHYDRIDE (CH₃N.CH₂CO)₂.

Freezing-point are given for mixtures of sarcosine anhydride and di phenyl amine by Pfeiffer and Angern, 1926. Results for mixtures of sarcosine anhydride and each of the following compounds are given by Pfeiffer and Seydel, 1928b: *o* amino phenol, *m* amino benzoic acid methyl ester, *p* oxy benzoic acid methyl ester and orthoform. For other results see Sarcosine, C₃H₇O₂N.

Di ETHYL OXALATE (COOC₂H₅)₂.

Freezing-point data for mixtures of diethyl oxalate and hydroquinol, resorcinol and β naphthol are given by Kremann, Zechner and Drazil, 1924. Results for mixtures of diethyl oxalate and trichlor acetic acid are given by Kendall and Booge, 1916.

Di METHYL SUCCINATE (CH₂)₂(COOCH₃)₂.

Freezing-points are given for :

Dimethyl succinate	+	Acetic acid (Kendall and Booge, 1916.)
"	"	+ Acetylene methyl-tetra carbonate (Timmermans and Vesselovsky, 1931.)
"	"	+ Chlor acetic acid (Kendall and Booge, 1916.)
"	"	+ Methyl fumarate (Viseur, 1926.)
"	"	+ Methyl maleate " "
"	"	+ Succino nitrile (Timmermans and Vesselovsky, 1931.)
"	"	+ Tri chlor acetic acid (Kendall and Booge, 1916.)

***n* PROPYL MALONIC ACID** CH(C₃H₇)(COOH)₂.

100 gms. H₂O dissolve 202.2 gm. CH(C₃H₇)(COOH)₂ at 25°.

100 gms. C₆H₆ dissolve 0.052 gm. CH(C₃H₇)(COOH)₂ at 25°.

(Verkade and Coops, 1930a.)

ADIPIC ACID (Normal) (CH₂)₄(COOH)₂.

100 grams H₂O dissolve 1.44 grams adipic acid at 15°.

(Henry — Compt. rend., 99, 1157, '84; Lamouroux — *Ibid.*, 128, 998, '99.)

100 grams of formic acid (95% HCOOH) dissolve 4.04 grams of (CH₂)₄(COOH)₂ at 18.5°; 100 cc. of the saturated solution contain 4.684 grams of the acid. (Aschan, 1913.)

Diagrams showing the solubility of adipic acid in binary mixtures of water, acetone, methyl alcohol, ethyl alcohol, propyl alcohol and carbon tetrachloride at 20° and at 40° are given by Bancroft and Butler, 1932.

Sodium ADIPATES.

SOLUBILITY OF EACH SEPARATELY IN AQUEOUS ETHYL ALCOHOL AT 23-25°.
(McDermott, 1940.)

Salt	Vol. % C_2H_5OH in Solvent	Gms. salt per 100cc solvent
$(CH_2)_4(COOH)COONa \cdot H_2O$	65.8	3.88
$(CH_2)_4(COONa)_2$	60.0	3.00

METHYL MALATE $CH_2CH(OH)(COOCH_3)_2$.

Freezing-point data for mixtures of methyl malates and methyl tartrates and methyl chloro succinate are given by Timmermans and Mme. Vesselovsky, 1932.

GLYCOGEN $(C_6H_{10}O_5)_x$.

SOLUBILITY OF GLYCOGEN IN WATER.
(Kerley 1930.)

Since the usual method of preparing glycogen by boiling tissue with 60% KOH appeared to affect its solubility, samples were prepared by dehydration with alcohol and subsequent extraction with water. Samples prepared without boiling with alkali, take from 3 to 4 days to reach saturation in water. Similar samples boiled for 2½ hours with 60% potassium hydroxide reached a slightly higher solubility value within a few hours. The solubility determinations were made under sterile conditions. Successive small portions of the saturated solutions were withdrawn at intervals and analyzed by a micro modification of Pfluger's method of estimating glycogen.

Sample employed	t°	Gms. glycogen dissolved per 100 gms. sat. sol.
Muscle glycogen not boiled with KOH	0	16.0
" " " " " "	20	17.7
" " " " " "	37	40.0+
Frog muscle glycogen	20	14.9
Rabbit liver glycogen	20	21.0

Glycogen is slightly soluble in aqueous alcohol. Results are given showing the decreasing solubility of glycogen with increasing concentration of alcohol in presence of potassium acetate, potassium trichlor acetate, potassium hydroxide and trichlor acetic acid.

BROMURAL (α Bromo Iso Valerylurea) $NH_2 \cdot CO \cdot NH \cdot COCHBrCH(CH_3)_2$.

Freezing-point data are given for mixtures of:

Bromural + Salol (Hrynakowski and Szmyt, 1935d.)
" + Phenacetine " " "
" + Pyramidon (Sandquist and Hök, 1927.)

UREIDES C₆H₁₁O₂N₂Br.

SOLUBILITY OF SEVERAL UREIDES, EACH SEPARATELY, IN
WATER AND IN OIL AT (?) TEMPERATURE.

TETRA METHYL THIURAM SULFIDE [(CH₃)₂NCS]₂.

Determinations of the solubility of tetra methyl thiuram sulfides (sulfide, bis (dimethyl thio carbamyl) and other compounds in rubber, by means of microscope examinations of prepared samples are described by Morris, 1932.

CYCLOHEXANE (Hexamethylene, Hexahydrobenzene) CH₂ < (CH₂.CH₂)₂ > CH₂.

THE MUTUAL SOLUBILITY OF CYCLOHEXANE AND METHYL ALCOHOL.
(Timmermans, 1912.)

The following determinations of the critical temperature of solution at high pressures are given. The constants of the cyclohexane were : b. pt. 80°.75; f. pt. + 6°.5. The methyl alcohol was rendered anhydrous by distilling over sodium.

Pressure in kilogram.	Critical temp. of solution.	Pressure in kilogram.	Critical temp. of solution.
50.....	59.45	400.....	69.10
100.....	61.02	700.....	75.26
200.....	63.98	1000.....	81.0

The triphase system crystallizes at + 5°.

RECIPROCAL SOLUBILITY OF CYCLOHEXANE AND LIQUID SULFUR DIOXIDE.
(Seyer and Dunbar, 1922.)

The cyclohexane had a boiling point of 79° and freezing-point of +6.4. It was dried by refluxing over sodium. The SO₂ was the ordinary commercial product carefully freed of H₂O. Weighed amounts of the two constituents were sealed in bulbs of about 15 cc. capacity and the temperatures at which two distinct layers or cyclohexane crystals just appear, were determined.

Solubility of the Two Liquids.				Temperatures at Which Cyclohexane Crystals Appear.

The critical solution temperature of mixtures of cyclohexane and liquid sulfur dioxide is 12° and the reciprocal solubility curve is practically flat between the concentrations 40 and 90 mol. percent SO₂.
(Leslie, 1934.)

The critical solution temperature of mixtures of cyclohexane and aniline is 31°. The calculated critical solution temperature of mixtures of cyclohexane and *m* toluidine is -18°. (Dessart, 1926.)

The critical solution temp of cyclohexane + propionitrile is 12°.2 and the mixture contains 70 per cent of cyclohexane. (Hortenber, 1926.)

The critical solution temp of methylcyclohexane and *o* toluidine is - 5°.6 and the mixture contains 45.5 per cent methyl cyclohexane. (Hortenber, 1926.)

Numerical data are given by Dessart, 1926, for the curve of separation in the system methyl cyclohexane + *m* toluidine.

Freezing-point data are given for mixtures of Cyclohexane and:

Acetic acid(1)	Chloroform(10)	Nitro benzene(6)
Aniline(2)(6)	Dicetyl (dotria contane)(9)	Nitro toluenes(6)(3)
Azobenzene(7)	Ethylene bromide(1)	Piperidine(8)

CYCLOHEXANOL

EQUILIBRIUM IN THE SYSTEM CYCLOHEXANOL AND WATER.
(Sidgwick and Sutton, 1930.)

The determinations were made by the synthetic method. In the case of the portion of curve where solid cyclohexanol separated, 88-93%, the mixtures were super cooled and then warmed slowly and the temperature noted at which only a trace of solid remained.

METHYL n BUTYL KETONE (2-HEXANONE) $\text{CH}_3\text{CO}(\text{CH}_2)_3\text{CH}_3$.

METHYL Iso BUTYL KETONE (2- Pentanone-4. methyl) $\text{CH}_3\text{COCH}_2\text{CH}(\text{CH}_3)_2$.

SOLUBILITY OF EACH SEPARATELY IN WATER.

(Gross, Rintelen and Saylor, 1939.)

The saturated solutions were analyzed by means of a Zeiss combination liquid and gas interferometer.

TRI CAPROIN $\text{C}_3\text{H}_5(\text{CH}_2)_4\text{COO})_3$.

Results for the reciprocal solubility of tri caproin and benzene are given by Loskit, 1928.

PARALDEHYDE $(CH_3CHO)_3$.

RECIPROCAL SOLUBILITY OF PARALDEHYDE AND WATER. (Pascal and Dupuy, 1920.)

Mixtures of paraldehyde and water were cooled or warmed while being energetically agitated and the temperature of appearance or disappearance of clouding determined to within 0.5°. At temperatures above 50° it was necessary to renew the mixture for each determination to avoid the production of a small amount of aldehyde. The paraldehyde was purified by drying and recrystallizing many times until the fusion-point became constant at 12.4°. It contained so little aldehyde that it scarcely gave a coloration with Schiff's reagent.

16-18	0.109	(Blix, 1928.)	25	0.115.	(Sano, 1926.)
19	0.113	(Neuberg, 1905.)	25	0.109	(McMeekin, Cohn and Blanchard, 1937.)
20	0.168	(Pfeiffer and Angern, 1924.)	25	0.1095	(Dalton and Schmidt, 1935.)
20	0.190	(Hoffman and Gortner, 1922.)	25	0.108-0.113	(Loring and du Vigneaud, 1934.)
24-27.5	0.133	(Toennies and Lavine, 1930.)	25	0.1097	(Takahashi and Yaginuma, 1929.)

The solubility of other isomers of Cystine was studied by Andrews and de Beer 1928, and by Loring and du Vigneaud, 1934. The former obtained results which suggested that d cystine may be about 4 times as soluble as l cystine. The subsequent results of Loring and du Vigneaud showed however, that these two isomers have identical solubilities. They also found that a mixture of d and l cystine in contact with water is transformed slowly into dl cystine. A mixture of 0.020 gm. of l + 0.020 gm. of d cystine + 100 cc of H_2O , rotated constantly at 25° was found to contain the following amounts of cystine after successive intervals of time.

Time	Gms. Cystine per liter
After 15 minutes	0.202
" 10 hours	0.215
" 180 "	0.057

The solid phase after 180 hours, as shown by microscopic examination, consisted of dl crystals. The solubility of meso cystine was found to be 0.056 gm. per liter. The solubility of mixtures of the two inactive isomers and of mixtures of the active and inactive isomers was found to be approximately the summation of the individual solubilities of each isomer.

SOLUBILITY OF L CYSTINE IN WATER.

(Dalton and Schmidt, 1935.)

The following values were derived from a solubility equation calculated from 20 very careful determinations at 9 different temperatures between 0° and 65° . The sample of cystine was prepared from a cystine stone taking care that the preparation should not be in contact with acid any longer than absolutely necessary and crystallizing twice from hot water. Determinations made with 0.01 gm. and with 0.10 gm. of sample per 60 cc of water gave results which agreed within 3 percent hence only insignificant amounts of inactive isomers were present.

CYSTINE

SOLUBILITY OF L CYSTINE IN AQUEOUS SALT SOLUTIONS AT $16-18^\circ$

(Blix, 1928.)

The experiments were made by adding 0.15 -0.20 gm. L cystine to 15-20 cc of 0.1 N NaOH and then the amount of salt to yield the desired final concentration, next enough 0.1 N CH_3COOH to bring the p_H to 5.6 (the mean of urine p_H) and finally enough H_2O to bring the volume to 300 cc. A drop of $CHCl_3$ was added to prevent growth of bacteria. The mixtures were shaken constantly for 5 hours daily for 5 days. The cystine in the saturated solutions was calculated from determinations of sulfur made by oxidizing with alkaline permanganate and precipitating with $BaCl_2$.

Salt and conc. in normality	Gms. Cystine per liter sat. sol.	Salt and conc. in normality	Gms. Cystine per liter sat. sol.
KCl 0.25N	0.133	NaH_2PO_4 }

KH_2PO_4 }		"	1.00 0.274
+ K_2HPO_4 }	0.133		

The influence of the diffusible organic substances and of the colloids of urine upon the solubility of cystine was also studied. The solubility of cystine in urine is greater than corresponds to the increase produced by the combinations studied.

SOLUBILITY OF CYSTINE IN AQUEOUS ALCOHOL

Experiments showing the influence of pH and of several salts upon the solubility of cystine in water are given by Okabe, 1928. Constant agitation was not employed for reaching equilibrium. The prepared mixtures were cooled to 0° and the excess of dissolved cystine was caused to crystallize out by stirring now and then during one hour. A minimum solubility of about 0.05 gm. cystine per liter in 0.046 mol. NaCl and NH_4Cl solutions was found at pH 6.0. NaCl, $(NH_4)_2SO_4$ and Na_2SO_4 increase the solubility of cystine, NH_4Cl and CH_3COONH_4 have no effect and C_2H_5OH decreased its solubility in water.

SOLUBILITY OF PHENYLHYDRAZONES AND β NAPHTHYLHYDRAZONES OF THE SUGARS IN WATER AND IN ALCOHOLS AT 16°-18°.

(van Ekenstein and de Bruyn, 1896.)

The hydrazones were prepared by adding to a concentrated and warm solution of the sugar the equivalent quantity of the hydrazine dissolved in the molecular quantity of glacial acetic acid. The precipitated hydrazones were recrystallized from 30 to 50 per cent alcohol. No details in regard to the method of obtaining saturation or of analysis of the solutions are given.

PIPECOLINE C₅H₉(CH₃)NH *d* and *l*.

F-pt. data for mixtures of *d* and *l* pipercoline are given by Ladenburg and Sobecki (1910).

PROPYL URETHAN C₃H₇NHCOOC₂H₅.

100 gms. H₂O dissolve 8.34 gm. C₈H₁₃O₂N at 15.5°. (Föhner, 1924.)

LEUCINES $C_6H_{13}O_2N$

SOLUBILITY OF dl ISOLEUCINE, d ISOLEUCINE, dl LEUCINE
l LEUCINE AND dl NORLEUCINE, EACH SEPARATELY IN WATER.
(Dalton and Schmidt, 1933, 1935.)

The following values were derived from solubility equations calculated in each case from a series of from 18 to 40 very careful determinations at 9 to 10 different temperatures between 0 and 70°.

t°	Gms. of each compound separately per 100 gms. H ₂ O				
	dl Leucine (CH ₃) ₂ CHCH ₂ CH (NH ₂)COOH	l Leucine (CH ₃) ₂ CHCH ₂ CH (NH ₂)COOH	dl Isoleucine CH ₃ CH ₂ CH(CH ₃) CHNH ₂ COOH	d Isoleucine CH ₃ CH ₂ CHCH ₃ CHNH ₂ COOH	dl Norleucine CH ₃ (CH ₂) ₃ CH (NH ₂)COOH
0	0.797(0.8812)	2.270	1.826(1.750)	3.791	0.843(0.9085)

40	1.203	2.658	2.647	4.483	1.449
45	1.297	2.764	2.828	4.641	1.579
50	1.406(1.764)	2.887	3.034(3.020)	4.818	1.727(1.800)
55	1.531	3.028	3.270	5.017	1.895
60	1.678	3.189	3.539	5.240	2.088
65	1.848	3.374	3.848	5.488	2.309
70	2.046	3.584	4.201	5.765	2.566
75	2.276(2.840)	3.823	4.607(4.827)	6.076	2.861(2.881)
100	4.206(4.83)	5.638	7.802(9.04)	8.255	5.229(4.70)

The results in parentheses are by Dunn, Ross and Read, 1933.

The results of Pfeiffer and Würigler, 1916, and others agree fairly well with the above values for dl Leucine.

The results of Takahashi and Yaginuma, 1928, 1929, agree well with the above values for l Leucine.

The following specific gravity determinations at 25° are given by Dalton and Schmidt:

Compound	Gms. compound per :		Sp. Gr.
	100 gms. sat. sol.	100 gms. H ₂ O	
dl Leucine	1.029	1.039	0.99883
l Leucine	2.341	2.397	1.00146
" "	1.147	1.160	0.99917

The above determinations were made by shaking the mixtures in a thermostat for 2 days and titrating the clear solution by the Sørensen method. A titration after an additional period of 1 day showed that complete saturation had been reached in all cases.

SOLUBILITY OF LEUCINE IN AQUEOUS SOLUTIONS OF DIFFERENT HYDROGEN ION CONCENTRATION AT 25°. (Sano, 1926.)

A large excess of leucine was shaken in a thermostat at 25° with the aqueous solvent. The saturated solution was filtered and a portion used for the determination of p_H by means of the hydrogen electrode and another portion for the determination of nitrogen by the micro Kjeldahl method using iodometric titration according to Bang.

The minimum solubility at the isoelectric point is 2.588 gms. N. or 24.24 gm. leucine per liter at 25°.

SOLUBILITY OF LEUCINE IN WATER AND IN AQUEOUS SALT SOLUTIONS AT 21°. (Pfeiffer and Angern, 1924.)

A saturated aqueous solution of the amino acid was prepared by constant shaking in a thermostat for 3 days. To five cc. portions of this sat. solution amounts of the salts to yield 0.02 molecular concentration were added and the shaking continued for another 3 days. The amino acid salted out was filtered, dried at 120-130° and weighed. That remaining in solution was calculated by difference.

100 cc Butyric acid dissolve 0.024 gm. Leucine at 18°.

(v. Przylecki and Kasprzyk-Czaykowski, 1938.)

Results for the solubility of methyl, ethyl and propyl Leucine hydrochlorides in methyl, ethyl and propyl alcohols at various temperatures are given by Takahashi and Yaginuma, 1930, and Yaginuma, 1930.

HEXANE $n\text{-CH}_3(\text{CH}_2)_4\text{CH}_3$.

100 gms. sat. solution of hexane in water contain about 0.014 gm. C_6H_{14} at 15°.5.
(Fuhner, 1922.)

100 gms. aq. 0.4 g Sodium Oleate solution (= 10.8 gm. Na oleate per 100 gms. sol.) dissolve 2.4 gms. Hexane at 20° when dissolved directly and 7.3 gms. when mixed with oleic acid and the necessary amount of NaOH to neutralize the oleic acid is added.

100 gms. sat. solution of hexane in 92 wt. % alcohol contain 46.4 gm. C_6H_{14} at 15°.
(Ormandy and Craven, 1921.)

The critical solution temperature of hexane + methyl alcohol is at 42° and the mixture contains 80 per cent hexane. A mixture of equal weights of hexane and methyl alcohol has a mutual miscibility temperature of 35°.5. The effect of increasing amounts of water and of salts upon this temperature was studied.
(Howard and Patterson, 1926.)

SOLUBILITY OF HEXANE IN METHYL ALCOHOL.

(1) Upper critical solution temperature.

The critical solution temperature of mixtures of Hexane and Sulfur Dioxide is 12° and the reciprocal solubility curve at this temperature is practically flat between the concentrations 70 and 90 gm. mol. per cent SO_2 . (Leslie, 1934.)

2-METHYL PENTANE $(CH_3)_2CH(CH_2)_2CH_3$.

EQUILIBRIUM IN THE SYSTEM 2-METHYL PENTANE, PHENOL AND WATER. (Vondracek and Dostal, 1936.)

To mixtures of weighed amounts of phenol and water, weighed amounts of 2-methyl pentane were added and the temperatures determined at which turbidity appeared. From this series of determinations the compositions corresponding to the temperatures 20° and 30° were ascertained by graphical interpolation.

DI *n* PROPYL ETHER (C_3H_7)₂ORECIPROCAL SOLUBILITY OF DI *n* PROPYL ETHER AND WATER.

(Bennett and Philip, 1928.)

The determinations were made by the method of Hill, 1923, modified by reducing the scale of the apparatus to require only 4-5 cc of each liquid and adding a globule of Hg to hasten mixing.

t°	Wt. % (C_3H_7) ₂ O in Aq. Phase	Wt. % H ₂ O in Ether Phase	t°	Wt. % (C_3H_7) ₂ O in Aq. phase	Wt. % H ₂ O in Ether Phase
0	1.05	0.36	20	0.54	0.38
10	0.71	0.29	25	0.49	0.45
15	0.61	0.31			

The authors also give a series of determinations made by the synthetic method using both Di *n* Propyl Ether and *n* Propyl iso Propyl Ether.

Results for the Solubility in Water of:

Di <i>n</i> Propyl Ether		<i>n</i> Propyl iso Propyl Ether	
t°	Wt. % $C_6H_{14}O$ in Water	t°	Wt. % $C_6H_{14}O$ in Water
0	0.58	0	1.0 + (?)
10	0.41	10	0.75
15	0.38	15	0.60
20	0.30	20	0.51
25	0.25	25	0.47

NOTE.—It seems probable that a mistake in recording the above results in the original paper was made and the values for the two isomeric ethers by the synthetic method should be interchanged.

Determinations of the reciprocal solubility of propyl ether and water and of propyl ether and aqueous sulphuric acid are reported with insufficient details by Gajendragad and Jotkar, 1935.

Mono BUTYL GLYCOL ETHERS, normal and iso $C_6H_{14}O_2$.MUTUAL SOLUBILITY OF NORMAL AND OF ISO BUTYL GLYCOL ETHER IN WATER.
(Cox and Cretcher, 1926.)

These systems give curves which are complete circles, consequently for each concentration of glycol ether there is an upper solution temperature and a lower solution temperature.

Results for *n* Butyl Ether.(h. pt. = 170°.6; $d_{44}^{20} = 0.8011$)

MANNITOL $CH_2OH(CHOH)_4CH_2OH$

SOLUBILITY OF MANNITOL IN WATER. (Braham, 1919.)

The determinations were made with the greatest care. The results were plotted on a large scale diagram and the following values for regular intervals of temperature were obtained.

t°	Gms. $CH_2OH(CHOH)_4CH_2OH$ per 100 gms. H_2O .	Mol. fraction Mannitol in solution.	t°	Gms. $CH_2OH(CHOH)_4CH_2OH$ per 100 gms. H_2O .	Mol. fraction Mannitol in solution.

d-MANNITOL $CH_2OH(CHOH)_4CH_2OH$.

SOLUBILITY OF d MANNITOL IN SEVERAL SOLVENTS.

(Upson, Fluevog and Albert, 1935.)

The determinations were made by observing the temperatures at which the last crystal disappeared from mixtures of known amounts of solid and solvent contained in 3 to 15 cc sealed glass bulbs while being slowly heated

100gms. alcohol, Sp. Gr. 0.905, dissolve 1.56 gms. mannitol at 14°. (Krusemann, 1876.)

Data for the solubility of mannitol at high pressures are given by Cohen, Inouye and Euwen, 1910.

100 gms. sat. sol. in pyridine contain 0.47 gm. mannitol at 26°. (Holtz, 1905.)

100 gms. aq. 50% pyridine dissolve 2.46 gms. mannitol at 20-25°. (Dehn, 1917.)

Data for the ternary systems mannitol + succinic acid nitrile + water and mannitol + triethylamine + water, are given by Timmermans, 1907.

MANNITOL

Freezing-point data are given for mixtures of:

Mannitol	+ Antipyrine	(Pfeiffer and Seydel, 1928.)
"	+ Sarcosine anhydride	(Pfeiffer and Seydel, 1928.)
"	+ Erythritol	(Puschin and Dezelic, 1932.)
"	+ Palmitic acid	" " " "
"	+ Stearic acid	" " " "

SORBITOL etc. (Hexites) $C_6H_{14}O_6 \cdot \frac{1}{2}H_2O$

SOLUBILITY OF THE BENZALIC COMPOUNDS OF SOME POLYATOMIC ALCOHOLS
AT 16°-18°.

(de Bruyn and van Ekenstein, 1899.)

No details of the determinations are given. It is stated that the results are sufficiently exact for use in identifying hexites.

35	4.58	96.5	65	1.97	96.3

* Determinations made by "Synthetic Method," see Note, p. 392.

The lower critical solution temperature of a 34.0 percent solution of tri ethyl amine in ordinary water(H₂O) is 18.25°. (Timmermans and Hennaut-Roland, 1932.) The lower critical solution temperature of a 35.1 percent solution of tri ethyl amine in heavy water(D₂O) is 14.4°. The former increases 0.02° for each additional kilogram of pressure and the latter 0.023° for each additional kilogram of pressure between 10 and 70 kilograms. (Timmermans and Poppe, 1935.)

Freezing-point data for mixtures of tri ethyl amine and water are given by Guthrie, 1884, and Pickering, 1893. Data for the solubility of tri ethyl amine in water at high pressures are given by Kohnstamm and Timmermans, 1913.

SOLUBILITY OF TRIETHYLAMINE IN WATER AND IN AQ. ETHYL ALCOHOL
AT DIFFERENT TEMPERATURES.*

NITRO PHENYL CHLOROFORM $NO_2C_6H_4CCl_3$.

Freezing-point data for mixtures of o, m and p nitro phenyl, chloroform are given by Hollman, Vermeulen and de Mooy, 1914.)

Diiodo SALYCILIC ACID $I_2(3,5)C_6H_2COOH(1)OH(2)$.

One liter of water dissolves 0.166 gm. of the compound at 10° and 0.192 gm. at 25° .
 (Cofman, 1920.)

SULFO BENZOIC ACID CHLORIDE $OCCl.C_6H_4.SO_2Cl$.

Freezing-point data for mixtures of sulfo benzoic acid chlorides and benzene di sulfo chloride are given by Maarse, 1914.

BROMO NITRO BENZOIC ACID $NO_2 \cdot Br \cdot C_6H_3COOH$.

SOLUBILITY OF NITROBROMOBENZOIC ACIDS AND OF NITROCHLOROBENZOIC ACIDS IN WATER AT 25°.

(Holleman, 1910.)

Acid.	Gms. Acid per 100 cc. Sol.	Acid.	Gms. Acid per 100 cc. Sol.
$C_6H_3COOH \cdot NO_2 \cdot Br$ 1.2.3	0.033	$C_6H_3COOH \cdot NO_2 \cdot Cl$ 1.2.3	0.047
$C_6H_3COOH \cdot NO_2 \cdot Br$ 1.2.5	0.741	$C_6H_3COOH \cdot NO_2 \cdot Cl$ 1.2.5	0.967

Holleman also gives data for the solubility of various mixtures of the above two bromo compounds and of the two chloro compounds and uses the results for estimating the quantity of each in an unknown mixture.

DI CHLORO BENZOIC ACIDS $Cl_2 \cdot C_6H_3COOH$.

Freezing-point data are given for:

- 2.5 Dichloro benzoic acid + III chloro benzoic acid.
 " " " " + 2.3 Dichloro benzoic acid.
 (Hope and Riley, 1924.)

CHELIDONIC ACID $C_7H_4O_6 \cdot H_2O$.

100 gms. sat. sol. of chelidonic acid in water contain 1.15 gms. $C_7H_4O_6$ at 25°.

100 gms. sat. sol. of chelidonic acid in 0.5 molar aq. H_3BO_3 sol. contain 1.51 gms. $C_7H_4O_6$ at 25°.

(Verkade, 1924.)

(Verkade, 1924.)

DI NITRO BENZOIC ACID $3.5(NO_2)_2 \cdot C_6H_3 \cdot COOH$.

1000 gms. H₂O dissolve approx. 0.04 gm. *p* Cl.C₆H₄.COOH (Microbic Acid). (Otto, 1917, 1925.)

SOLUBILITY OF CHLORO BENZOIC ACIDS IN AQUEOUS POTASSIUM CHLORIDE
SOLUTIONS AT 25°.

(Osol and Kilpatrick, 1933.)

The experiments are concerned with the relation of the activity coefficients of the molecules of chloro benzoic acids and the "salting out" or "salting in" effect in aqueous salt solutions. In order to minimize the correction for the part present as ions, buffer solutions were used in all cases. These are characterized only in terms of molar concentrations of sodium salt.

Results for:

Gm. Mols. KCl per liter in each case	<i>o</i> Chloro benzoic acid in 0.01 molar sodium salt		<i>m</i> Chloro benzoic acid in 0.00212 molar sodium salt		<i>p</i> Chloro benzoic acid in 0.000342 molar sodium salt

* Slightly acidified with HCl.

† Containing 5 cc. conc. HCl per 100 cc.

The amount of saccharin entering the ethereal layer is increased by addition of HCl to the aqueous layer. With 5 cc. conc. HCl per 100 cc. H₂O, the distribution coefficient is reduced to 0.0624.**SOLUBILITY OF SACCHARIN IN MIXTURES OF ALCOHOL AND QUINOLINE AT 20-25°.**

NitroBENZALDEHYDES *o*, *m* and *p* $C_6H_4NO_2.CHO$.**SOLUBILITY OF ORTHO, META AND PARA NITROBENZALDEHYDES IN WATER.**
(Sidgwick and Dash, 1922.)

The sealed tube method was used at the higher temperatures and the Beckmann apparatus at the lower. The temperatures of the triple points (tr. pt.) corresponding to solid aldehyde in contact with two liquid layers, were determined in separate experiments and the composition estimated by extrapolation on the plotted curves. S indicates solid nitrobenzaldehyde. The complete solubility curves were realized for the meta and para compounds but that for the ortho compound could not be taken above 100° on account of decomposition.

SOLUBILITY OF ORTHO, META AND PARA NITRO BENZOIC ACIDS
IN AQUEOUS SOLUTIONS OF ELECTROLYTES AT 35°. (Yajnik, Jain and Nath, 1925.)

Saturated solutions of the acids were prepared at 45° and 100 cc. portions placed in flasks containing accurately weighed quantities of the various electrolytes. These were kept in a thermostat at 35° but no mention is made of stirring or agitation during the period of attainment of equilibrium. The acid present was determined by titration with standard alkali. Nothing is said about the separation of the solid phase. This is especially regrettable in the case of *p* nitro benzoic acid, which according to the authors' figures, is less soluble with increase of temperature. Also in some cases the reported increase in solubility with increase of concentration of electrolyte, is greater than the amount of acid which could have been present in a mixture made as described

Trinitro**TOLUENE** 2,4,6 C₆H₃CH₃(NO₂)₃.

100 gms. H₂O dissolve 0.021 gm. C₆H₃CH₃(NO₂)₃ at 15° and 0.164 gm. at 100°.

100 gms. alcohol dissolve 1.6 gms. C₆H₃CH₃(NO₂)₃ at 22° and 10 gms. at 58°.
(Copisarow, 1915.)

SOLUBILITY OF α OR 2, 4, 6 TRINITRO TOLUENE (TNT) IN WATER.

(Taylor and Rinkenbach, 1923; also quoted in full by Desvergues, 1924.)

Commercial Grade I trinitrotoluene was purified by recrystallization from hot benzene and from hot 95 % alcohol. Its setting point was 80°.6. The saturated solutions were prepared in triplicate by shaking frequently, during several hours, mixtures which had been heated to a temperature higher than that of the determination and afterwards kept in a thermostat. In some cases equilibrium was approached from below instead of above. About 30 to 50 grams of the saturated solution were weighed in a wagon pipet, the solvent evaporated by means of a current of warm dry air and the residue weighed after drying to constant weight. The determinations were plotted and the results for regular intervals of temperature were read from the curve.

SOLUBILITY OF α OR 2, 4, 6 TRINITRO TOLUENE (TNT) IN PYRIDINE.

(Taylor and Rinkenbach, 1923; also quoted by Desvergues, 1924.)

As in the case of the solubility in aniline, a complex is formed with pyridine. It was found to have the composition C₅ H₅ N·C₆ H₃ CH₃ (NO₂)₃ and m. pt. 40°-42°. The determinations were made in the same manner as described above. The approximate results obtained by the cooling curve method were corrected by means of accurate determinations of the saturation points of prepared mixtures. The authors' corrected values are as follows.

Gms. C ₆ H ₃ CH ₃ (NO ₂) ₃ per 100 gms. C ₅ H ₅ N.		Gms. C ₆ H ₃ CH ₃ (NO ₂) ₃ per 100 gms. C ₅ H ₅ N.		Gms. C ₆ H ₃ CH ₃ (NO ₂) ₃ per 100 gms. C ₅ H ₅ N.

SOLUBILITY OF α OR 2, 4, 6 TRINITRO TOLUENE (TNT) IN ANILINE.
(Taylor and Rinkenbach, 1923; also quoted by Desvergues, 1924.)

A large number of approximate determinations were made by the cooling curve method and four accurate determinations were made by the crystal growth method. These latter were used as fixed points for correcting the approximate curve. In the following table the results, showing grams per 100 grams sat. solution, were read from the authors diagram and the results showing grams per 100 grams of aniline were taken from his corrected table.

t°.	Gms. $C_6H_2CH_3(NO_2)_3$ per 100 gms.		Solid Phase.	t°.	Gms. $C_6H_2CH_3(NO_2)_3$ per 100 gms.		Solid Phase.

Results for mixtures of Ethoxy and Benzyloxy Nitro Anisoles are given by Robinson and Smith, 1926 and Oxford and Robinson, 1926.

TETRYL (2,4,6 Tri nitro phenyl methyl nitramine or tetra nitro methyl aniline) (NO₂)₃C₆H₂N(NO₂)CH₃.

SOLUBILITY OF TETRYL IN WATER.

(Taylor and Rinkenbach, 1923. The determinations are quoted in full by Desvergues, 1924.)

The sample of tetryl used was purified by recrystallizing a good commercial product. Its setting point was 128^o.72.

The saturated solutions were prepared in triplicate and equilibrium was approached from above and below. Constant agitation was not employed. The mixtures were shaken frequently for several hours and then allowed to settle two hours before a sample was removed for analysis. About 30-50 grams of the saturated solution were weighed in a wagon-pipet, the solvent evaporated, and the residue weighed after drying to constant weight. The determinations were plotted and the results for regular intervals of temperature were read from the curve.

100 gms. sat. solution of benzaldehyde in liquid ammonia contain about 82 gms. C_6H_5CHO at $? t^\circ$. (DeCarli, 1927.)

Freezing-point data are given for:

Benzaldehyde + Hydrocyanic acid (Peiker and Coffin, 1933.)
" + Nitric acid (Zukow and Kasatkin, 1909.)
" + Acetic acid anhydride (van der Beek, 1928.)
" + Tri chlor acetic acid (Kendall and Gibbons, 1915.)
" + Naphthols (Kremann and Zechner, 1925.)

o and *p* ChloroFORMANILIDES $Cl \cdot C_6H_4NH \cdot CHO$.

Freezing-point lowering data for mixtures of *o* and *p* chloroformanilide are given by King and Orton, 1911.

HydroxyBENZALDEHYDES *o*, *m* and *p* C₆H₄OH·CHO.SOLUBILITY OF EACH IN WATER.
(Sidgwick and Allott, 1923.)

The determinations were made by the synthetic, sealed tube, method. The concentrations are in terms of Wt. %, that is, the grams of *o*, *m* or *p* C₆H₄OH·CHO per 100 gms. sat. sol.

The points at which a second liquid phase separates are marked L. The unstable points are marked *.

Ortho Hydroxy BENZALDEHYDE (Salicylaldehyde) *o* OH·C₆H₄·CHO.

Freezing-point data are given by Kremann and Zechner, 1925 for mixtures of Salicylaldehyde and each of the following compounds:

1,2,4 Dinitro phenol, Hydroquinone, α and β Naphthols, *o* Nitrophenol Picric acid and Pyrogallol.

Meta Hydroxy BENZALDEHYDE m -OH.C₆H₄CHO.

Freezing-point data are given for mixtures of meta hydroxy benzaldehyde and:

Benzoic acid(1)	Naphthols(1)	Resorcinol(1)
Dinitro benzenes(1)	Nitro phenols(1)(5)	Salicylic acid(1)
Dinitro phenol(1)(5)	Phenol(1)(5)	Tri chlor acetic acid(3)
Dinitro toluene(1)(2)	Picric acid(1)(4)	Tri nitro toluene(1)
Hydroquinone(1)	Pyrogallol(1)	

(1) Kremann and Pogantsch, 1923; (2) Kremann and Mauermann, 1922; (3) Kendall and Gibbons, 1915; (4) Rheimboldt, Henning and Kircheisen, 1925; (5) Kremann and Zechner, 1926.

Para Hydroxy BENZALDEHYDE p -OH.C₆H₄CHO.

Freezing-point data are given for:

Para Hydroxy benzaldehyde	Dimethyl aniline (Schmidlin and Lang, 1912.)
" " "	Phenol " "
" " "	Trichlor acetic acid (Kendall and Gibbons, 1915.)

BROMO NITRO TOLUENES $BrNO_2C_6H_3CH_3$.

Freezing-point data for binary mixtures of the several isomeric bromo nitro toluenes are given by Coffee, 1926 and Geerling and Wibaut, 1934.

NITRO BENZYL BROMIDE p -C₆H₅CH.NO₂.Br.

Freezing-point data for mixtures of p nitro benzyl bromide and α benzal doxime are given by Brady and Klein, 1927.

NitroBENZYL CHLORIDE p -C₆H₅CHNO₂.Cl.

SOLUBILITY OF BENZOIC ACID IN BENZENE AND IN TOLUENE. Chapman, 1924.

An air jacketed test tube, provided with a stirrer and a thermometer, was used. Weighed amounts of benzoic acid and benzene were introduced and the mixture heated until entirely homogeneous. It was then cooled with rapid stirring until a cloud of minute crystals formed, and then warmed slowly with constant stirring until the cloud of crystals disappeared. The results were plotted and the following values read from the smooth curve.

100 gms. sat. solution of Benzoic Acid in liquid ammonia contain 46 gms. C_6H_5COOH at (?) t°. (DeCarli, 1927.)

Data for the reciprocal solubility of benzoic acid and sulfur are given by Hammick and Holt, 1927.

The critical solution temperature of mixtures of benzoic acid and α Chloro naphthalene is 95.5°.

The critical solution temperature of mixtures of benzoic acid and diphenyl is 87.5°. (Lecat, 1929.)

CHLORO NITRO TOLUENES $CH_3C_6H_3ClNO_2$.

Freezing-point data for binary mixtures of the isomeric chloro nitro toluenes are given by Wibaut, 1913; Holleman and Vander Arend, 1909.

NITRO BENZYL CHLORIDE $2 C_6H_4(NO_2)CH_2Cl$.

Freezing-point data for mixtures of 2 nitro benzyl chloride and benzen are given by Schmidlin and Lang, 1912.

SOLUBILITY OF SALICYLIC ACID (LIQUID) IN WATER.

Determinations by Synthetic Method. See Note, p. 517. The original data in each case were plotted and the following figures read from the curves.

°C.	Gms. $C_7H_6O_3$ (OH) per 100 gms. water		°C.	Gms. $C_7H_6O_3$ (OH) per 100 gms.	
	Aqueous Layer	Salicylic Acid Layer		Aqueous Layer	Salicylic Acid Layer
60	7	68	60	4.5	68
70	8	64	70	6.5	62.5
80	12	58	80	10	54
90	19	49	85	15	46

95 crit. temp.

32

87 crit. temp.

30

Data for the melting point curve of mixtures of solid salicylic acid and water are also given by Flaschner and Rankin

EQUILIBRIUM IN THE SYSTEM SALICYLIC ACID AND WATER. Hailey, 1925.)

The author obtained the following results which agree with those of Walker and Wood, 1898, up to 30° and are slightly higher, above this temperature. He points out that the determinations of Savorro, 1914, are probably too high. His values for the metastable region differ slightly from those of Flaschner and Rankin, 1910.

°C.	Gms. $C_7H_6O_3$ (OH) per 100 gms. sat. sol.		°C.	Gms. $C_7H_6O_3$ (OH) per 100 gms.	
	H_2O layer	Salicylic acid layer		H_2O layer	Salicylic acid layer
10	0.111		50	14.0	16.0
20	0.184		60	16.0	16.0
30	0.301		70	17.0	16.0
40	0.492		80	18.0	16.0
50	0.804		85	19.0	16.0
60	0.804		90	20.0	16.0

One liter of sat. solution of salicylic acid in water contains 1.71 gms. in 0.1 molar H_2BO_3 solution, 2.42 gms. and in 0.1 molar H_2HPO_4 solution, 4.21 gms. $(C_7H_5O_3COOH)$ (Kolthoff, 1926.)

More recent determinations of the solubility of salicylic acid in water are as follows:

°C.	Gms. $C_7H_5O_3COOH$ per liter sat. sol.	°C.	Gms. $C_7H_5O_3COOH$ per liter sat. sol.
0	0.89 - 0.95* (21) (3)	25	2.24 (5)
14.5	1.667 (1)	25	2.26 (18)
18	1.72 (4)	25	2.498 (4)
20	2.2* (9)	30	2.74 (4)
25	2.21 - 2.26* (21) (3)	30	3.1* (9)
25	2.21 (6)	40	3.93* (3)
25	2.20 (7)	50	5.72* (3)
		75	6.78* (3)

* per 1000 gms. H_2O .

SALICYLIC ACID

SOLUBILITY OF SALICYLIC ACID IN WATER.

(Siddgwick and Ewbank, 1921a.)

The determinations were made by the synthetic method.

t° of solid-liquid equilibrium	Gms. of $OH.C_6H_4.COOH$ per 100 gms. sat. solution	t° of solid-liquid equilibrium	Gms. of $OH.C_6H_4.COOH$ per 100 gms. sat. solution
50	0.557	106.7(89.1)	34.02
56	0.717	107.2(86.4)	48.18
80	2.026	109.5(67.0)	65.4
97.9	5.27	119.5	80.0
101.4(77.3)	8.02	131.8	89.75
105.6(87.2)	16.82	159.0(m.pt.)	100.00

The figures in parentheses are points on the liquid-liquid curve. The critical solution point of this curve is at approximately 90° and 30 wt. percent salicylic acid.

PHENYL URETHAN $NH_2COOC_6H_5$.

Freezing-point data for mixtures of phenyl urethan and antipyrine are given by Mazetti, 1926.

CHLORO NITRO TOLUIDINES $ClNO_2C_6H_4CH_3NH_2$.

Freezing-point data for mixtures (6) Chloro (4) nitro meta toluidine and (6) Chloro (3) nitro para toluidine are given by Morgan and Challenor, 1921.

TOLUENE SULFONYL CHLORIDES $CH_3 \cdot C_6H_4 \cdot SO_2Cl$.

Freezing-point data for mixtures of ortho and para toluene sulfonyl chlorides are given by Holleman and Caland, 1911, and by Harding, 1921.

NITRO ANISOLES *o* and *p* $NO_2C_6H_4OCH_3$.

1000 gms. H_2O dissolve 1.69 gms. ortho anisole at 30° .

1000 gms. H_2O dissolve 0.589 gms. para anisole at 30° .

(Gross, Saylor and Gorman, 19

Freezing-point data are given for mixtures of *p* Nitro anisole and:

Diphenyl amine(4)(5)

Nitro penta erythritol(6)

Mercuric chloride(2)(3)

Tri methylene tri nitramine(7)

Nitro mannitol(6)

Urethan(2)(5)

Results for mixtures of Di nitro anisole and Di nitro phenetol are given by (1).

(1) Blanksma, 1914; (2) Mascarelli, 1908, 1909; (3) Mascarelli and Ascoli, 1907; (4) Puschin, 1926b; (5) Puschin and Grebenschukov, 1913, 1925; (6) Urbanski, 1933; (7) Urbanski and Radek-Gawronska, 1934.

AZOLITMINE $C_7H_7NO_4$.

100 gms. H_2O dissolve 39.5 gms. azolitmine at 20° - 25° .

(Deha, 1917.)

100 gms. pyridine dissolve 0.05 gm. azolitmine at 20° - 25° .

"

100 gms. aq. 50% pyridine dissolve 0.12 gm. azolitmine at 20° - 25° .

"

TOLUENE $C_6H_5CH_3$.

SOLUBILITY OF TOLUENE IN WATER.

t° .	$Co. C_6H_5CH_3$ per 100 cc. H_2O .	Authority.	t° .	$Co. C_6H_5CH_3$ per 100 cc. H_2O .	Authority.
16.....	0.057	Fühner, 1924	150.....	0.2	Jaeger, 1923
25(?)..	0.063	Horiba, 1917	200.....	0.7	"
100.....	<0.10	Jaeger, 1923	350.....	2.8	"
			300	13.0	"

The determination of Fühner was made by adding the toluene from a buret to a measured volume of water until saturation was reached. The determinations of Jaeger were made in a large shaking autoclave of more than two liters capacity. A measured volume of the saturated solution was cooled and after it had separated into two layers the volume of toluene was measured.

100 gms. H_2O dissolve 0.057 gm. $C_6H_5CH_3$ at 30° . (Gross and Saylor, 1931.)

100 gms. H_2O dissolve 0.0368 gm. $C_6H_5CH_3$ at 10° and 0.0492 gms. at 25° . (Uspenski, 1929.)

SOLUBILITY OF WATER IN TOLUENE.

The results of Tarassenkow and Poloshinzewa, 1932; Rosenbaum and Walton, 1930 and of Uspenski, 1929, were plotted and the following values read from the curve.

t°	Gms. H_2O per 100 gms. sat. sol.	t°	Gms. H_2O per 100 gms. sat. sol.	t°	Gms. H_2O per 100 gms. sat. sol.
-10	0.02(0.002)	25	0.050(0.045)	60	0.15
0	0.027(0.007)	30	0.057(0.052)	70	0.21
+10	0.035(0.020)	40	0.075(0.075)	80	0.275
20	0.045(0.035)	50	0.10	90	0.375

The results in parentheses and above 50° are by Tarassenkow and Poloshinzewa.

TOLUENE

100 gms. 0.4 normal aq. sodium oleate solution (= 10.8 gms. Na oleate per 100 gms. solution) dissolve 3.5 gms. $C_6H_5CH_3$ at 20° . When the oleic acid and toluene are mixed and the calculated amount of NaOH added to neutralize the oleic acid is added and the mixture diluted with water to 0.4 normality, the solubility of the toluene is 11.4 gms. $C_6H_5CH_3$ per 100 gms. sat. solution at 20° . (Smith, 1932.)

RECIPROCAL SOLUBILITY OF TOLUENE AND SULFUR.

(Alexejew, 1886.)

The synthetic method was used. The results were plotted and the following values read from the curve.

t°	Gms. $C_6H_5CH_3$ per 100 Gms.		t°	Gms. $C_6H_5CH_3$ per 100 Gms	
	S Layer.	Toluene Layer.		S Layer.	Toluene Layer.

A few determinations are also given of the solubility of meta cresol in aqueous solutions of phosphoric acid-sodium phosphate mixtures.

Data for equilibrium in the systems o, m and p cresols, Sodium Oleate and Water by Bailey, 1923, are given on p. 1188 of Vol. I. of this compilation.

100 gms. 0.4 normal aqueous sodium oleate solution (10.8 gm. Na oleate per 100 gms. solution) dissolve 37.6 gm. ortho cresol at 20°.
 (Smith, 1932.)

EQUILIBRIUM IN THE SYSTEM ORTHO CRESOL, METHYL ALCOHOL AND WATER.
(Szelenyi, 1929.)

The determinations were made by the synthetic method. The results were plotted and the following values obtained for the iso thermal curves.

Gms. per 100 gms. homogeneous mixture			Gms. per 100 gms. homogeneous mixture			Gms. per 100 gms. homogeneous mixture

DISTRIBUTION OF CRESOL BETWEEN WATER AND ETHER. (Vaubel, 1903.)

Composition of Solvent.	Gms. Cresol in H_2O Layer.	In Ether Layer.
200 cc. H_2O +100 cc. Ether	0.0570	1.0760
200 cc. H_2O +200 cc. Ether	0.0190	1.1144

One liter aqueous 1 normal solution of the sodium salt of *o*-cresol dissolves 7.57 gms. *o*-cresol at 25°, 8.32 gms. at 40°, 9.84 gms. at 60° and 13.62 gms. at 80° (Schlenker, 1900).

MISCIBILITY OF AQUEOUS ALKALINE SOLUTIONS OF *o*-CRESOL WITH SEVERAL ORGANIC COMPOUNDS INSOLUBLE IN WATER.

(Schlenker, 1900.)

To 5 cc. portions of aq. KOH solution (250 gms. per liter) were added the given amounts of the aq. insoluble compound from a buret, and then the *o*-cresol dropwise, until solution occurred. Temp. not stated.

Composition of Homogeneous Solution

cc. Aq. KOH.	Aq. Insol. Compd.	o-cresol
5	2 cc. (1.64 gms.) Octyl Alcohol*	1.1 gms.
5	5 " (4.1 ") " "	1.8 "
5	2 " (1.74 ") Toluene	4.4 "
5	3 " (2.61 ") " "	5.1 "
5	2 " (1.36 ") Heptane	6.4 "

* = the normal secondary alcohol, the so-called capryl alcohol, $C_{17}H_{35}O$, $H_{17}O$, $H_{17}O$, $H_{17}O$.

RECIPROCAL SOLUBILITY OF ORTHO-CRESOL AND ETHYL ALCOHOL, DETERMINED BY THE FREEZING-POINT METHOD. (Perrakis, 1925.)

t° of Crystallization.	Mol. per cent C_7H_8O in sat. sol.	t° of Crystallization.	Mol. per cent C_2H_5OH in sat. sol.
29.05.....	100.00	1.00	21.10

DISTRIBUTION OF ACETIC ACID AT 20° BETWEEN WATER AND ORTHO TOLUIDINE.
(Angelescu, 1925.)

In connection with the results showing the solubility of ortho toluidine in aqueous solutions of acetic acid, a series of determinations of the distribution of acetic acid between water and toluidine was needed in order to ascertain the composition of those solutions in contact with each other at a given temperature. The results which were obtained are as follows.

Gms. CH ₃ COOH per 100 gms.		$\frac{C_2}{C_3}$	Gms. CH ₃ COOH per 100 gms.		$\frac{C_1}{C_3}$
H ₂ O layer (C ₁).	Toluidine layer (C ₂).		H ₂ O layer (C ₃).	Toluidine layer (C ₄).

11.37	8.12	1.40	19.41	18.06	1.07

Angelescu, 1925, next determined the temperatures at which two layers are formed in solutions containing constant concentrations of acetic acid and variable percentages of water and ortho toluidine. For this purpose mixtures of toluidine and acetic acid and of water and acetic acid, containing in both cases the same weight per cent of acetic acid, were prepared. Variable mixtures of these two solutions yield in every case a ternary mixture containing a constant percentage of acetic acid. On gradually changing the temperature of such ternary mixtures, containing respectively 19.94, 21.84, 23.33 and 23.60 per cent of CH₃(CO)OH, an upper and a lower point was found at which clouding occurs. Thus for these ranges of concentration, the systems yield closed curves of solubility having an upper and a lower critical temperature of solution. The following results were obtained.

**VARIATION OF THE TEMPERATURE OF SOLUTION IN A TERNARY MIXTURE OF
ORTHO TOLUIDINE CONTAINING 19.94 PER CENT OF ACETIC ACID.**

HEPTANE $nCH_2(CH_2)_5CH_3$.

100 gm. sat. solution of heptane in water contains about 1000 gms. $(H_2)_2C=CH_2$, CH_3
at 15° . (Lohm, 1923.)

100 gm. sat. solution of heptane in 99 wt. % alcohol contains 26.7 to 28.5 gms.
 $CH_3(CH_2)_5CH_3$ at 15° . (Mann and Crisp, 1921.)

EQUILIBRIUM IN THE SYSTEM NORMAL HEPTANE, PHENOL AND WATER.
(Vondracek and Dostal, 1936.)

The temperatures of appearance of opalescence in known mixtures were determined. The following values for 20° and 30° were obtained by graphical interpolation.

Results at 20°

Results at 30°

Gms. per 100 gms. homogeneous mixture			Gms. per 100 gms. homogeneous mixture		
C_7H_{14}	C_6H_5OH	H_2O	C_7H_{14}	C_6H_5OH	H_2O
8.77	86.89	4.34	10.29	85.44	4.27
6.22	85.27	8.51	7.27	84.32	8.42

2.96	74.68	22.36	3.39	74.35	22.27

The critical solution temperature of mixtures of normal heptane and liquid sulfur dioxide is 19° and the reciprocal solubility curve at this temperature is practically flat between the concentrations 50 and 90 mol. percent SO_2 . (Leslie, 1934.)

Freezing-point data are given for mixtures of normal Heptane and:

Benzene (Ormandy and Craven, 1926.)
Phenol (Campetti and Delgrosso, 1913.)
Tri methyl pentane (Smittenberg, Hoog and Henkes, 1938.)

METHYL CYCLO HEXANE $C_6H_{11}CH_3$.

EQUILIBRIUM IN THE SYSTEM METHYL CYCLOHEXANE, PHENOL AND WATER.
(Vondracek and Dostal, 1936.)

The temperatures of appearance of opalescence in known mixtures were determined. The following values for 20° and 30° were obtained by graphical interpolation.

Results at 20°

Results at 30°

Gms. per 100 gms. homogeneous mixture			Gms. per 100 gms. homogeneous mixture		
$C_6H_{11}CH_3$	C_6H_5OH	H_2O	$C_6H_{11}CH_3$	C_6H_5OH	H_2O

The critical solution temperature of mixtures of Methyl cyclo hexane and liquid Sulfur Dioxide is 15° and the reciprocal solubility curve at this temperature is practically flat between the concentrations 40 and 90 mol. percent SO_2 . (Leslie, 1934.)

Freezing-point data are given for mixtures of Methyl cyclo hexane and:

Carbon disulfide(5) (Hexane(5) (Pentane(5)
Cyclohexane(4) Nitro toluene(1) Toluidine(1)(2)
Hydrobromic acid(3)

OENANTHOL (Enanthaldehyde) $CH_3(CH_2)_5CHO$.

FREEZING-POINTS OF MIXTURES OF OENANTHOL AND WATER. (Noorduy, 1919.)

t° of f. pt.	Mol. per cent $C_7H_{14}O$ in mixture	Solid Phase
-42.....	100	$C_7H_{14}O$
-42.5 (Eutec.).....	trace H_2O present	" $C_7H_{14}O \cdot H_2O$
+11.4.....	99	$C_7H_{14}O \cdot H_2O$ + two liquid layers
+11.4.....	0.019	"
-0.058 (Eutec.)...	0.016	$C_7H_{14}O \cdot H_2O$ + Ice
0.0.....	0.0	Ice

The solubility of oenanthol in water at 11° was found to be 0.124 gm. (0.019 gm. mol.) $C_7H_{14}O$ per 100 gms. sat. sol.

HEPTYL ALCOHOL $n\text{-}CH_3(CH_2)_5CH_2OH$.

SOLUBILITY OF *n* HEPTYL ALCOHOL IN WATER. (Lohmeyer, 1921.)

The determinations were made by the synthetic method and from the curve obtained, the following results were read.

t°	sat. sol.	100 gms. sat. sol.	100 gms. sat. sol.	100 gms. sat. sol.	100 gms. sat. sol.	100 gms. sat. sol.	100 gms. sat. sol.
Gms. $CH_3(CH_2)_5CH_2OH$ per 100 gms. sat. sol.	0.181	0.170	0.220	0.280	0.340	0.410	0.480

An approximate determination at 18° gave 0.10 gm. per 100 gm. sat. sol.

100 gms. sat. solution of normal Heptyl alcohol in water contain 0.181 gms. $CH_3(CH_2)_5CH_2OH$ at 25° . (Butler, Thomson and MacLennan, 1933.)

DIPROPYL KETONE $(C_3H_7)_2CO$.

SOLUBILITY OF DIPROPYL KETONE IN WATER.

(Urson, Rintelen and Meyer, 1920.)

t°	abs. Mols. $(C_3H_7)_2CO$ per 1000 gms. H_2O
0	0.00644
10	0.00666
30	0.01145
50	0.02888
75	0.0272

METHYL AMYL KETONE $(CH_3)(C_5H_{11})CO$.

100 gms. sat. sol. of methyl amyl ketone in water contain 1.98 gms.

$CH_3(C_5H_{11})CO$ at 25° .

100 gms. sat. sol. of water in methyl amyl ketone contain 2.15 gms. H_2O at 25° .

(Park and Hofman, 1932.)

UREIDE OF GLUCOSE $CH_2OH(CHOH)_4CH_2NCO.NH_2$.

100 gms. absolute ethyl alcohol dissolve 0.04 gm. ureide of glucose at 25° .

" 85.6% " " 0.73 " " "

" methyl alcohol " 0.22 " " "

(Schroder, 1901.)

AMYL ACETATES (normal and iso) $CH_3COOC_5H_{11}$.

100 cc H_2O dissolve 0.2 cc normal amyl acetate at 20° .

100 cc H_2O dissolve 0.2 cc (1.27) iso amyl acetate at 20° .

(Traube, 1884; Hauser, 1895.)

100 cc H_2O dissolve 0.2 cc secondary amyl acetate at 25° . (Park and Hopk, 1930.)

RECIPROCAL SOLUBILITY OF AMYL ACETATES, ETHYL ALCOHOL AND WATER.
(Pfeiffer, 1892.)

i BUTYL URETHAN $\text{C}_4\text{H}_9\text{.NH.COO.C}_2\text{H}_5$.

100 gms. H_2O dissolve 2.042 gms. $\text{C}_7\text{H}_{15}\text{O}_2\text{N}$ at 15.5°. (Fuhner, 1924.)

2- METHYL HEXANE $(\text{CH}_3)_2\text{CH}(\text{CH}_2)_2\text{CH}_2\text{CH}_3$.

The critical solution temperature of mixtures of 2-Methyl Hexane and Sulfur Dioxide is 18° and the reciprocal solubility curve at this temperature is practically flat between the concentrations 58 and 83 mol. percent SO_2 . (Leslie, 1934.)

2,2,3-TRI METHYL BUTANE $\text{CH}_3\text{C}(\text{CH}_3)_2\text{CH}(\text{CH}_3)\text{CH}_3$.

Freezing-point data for mixtures of tri and tetra methyl butane are given by Smittenberg, Hoog and Henkes, 1938.

HEPTANE C_7H_{16} .

100 gms. H_2O dissolve 0.005 gm. C_7H_{16} at 15.5°. (Fuhner, 1924.)

n HEPTYL ALCOHOL

SOLUBILITY OF n HEPTYL ALCOHOL IN WATER.

Brom ACETANILIDE $BrC_6H_4NHCOCH_3(p)$.

Freezing-point data for mixtures of Brom acetanilide and dibrom acetanilide are given by Sidgwick, 1915.

Freezing-point data for mixtures of aceto-2-chloranilide and aceto-4-chlor anilide are given by Orton and Owen, 1924.

ChlorACETANILIDES, $ClC_6H_4NH.COCH_3, o, m$ and p .

SOLUBILITY OF EACH IN WATER (Sidgwick and Rübke, 1924)

NOTE. — The determinations were made by the synthetic method. Sealed bulbs of 2 or 3 cc. capacity were used at the higher temperatures and a Beckmann apparatus at the lower temperatures. Those points at which the solid phase separated are marked with an asterisk, the others show the composition of one of the two liquid layers which are formed. The triple point was determined in all cases but not the critical temperature of the liquid layers.

One liter sat. solution in water contains 0.42 gram *p* toluic acid at 25°. One liter sat. solution in 1 *N* aq. sodium *p* toluate contains 0.735 gm. *p* toluic acid at 25°. (Sidgwick, 1910.)

SOLUBILITY OF TOLUIC ACIDS (EACH SEPARATELY) IN WATER AT VARIOUS TEMPERATURES.

(Sidgwick, Spurrell and Davies, 1915.)

The determinations were made by the synthetic method, see p. 16; melting-point of *o* toluic acid = 102.4°, of *m* acid = 110.5° and of *p* acid = 176.8°. The triple point (solid phase present) for the *o* acid, is at 93.5° and the concentration of acid in the two layers is 2.5 and 91.2 gms. respectively per 100 gms. sat. solution. The tr. pt. for the *m* acid is at 91.8° and concentrations are 1.6 and 90.5; the tr.-pt. for the *p* acid is at 142° and concentrations, 5 and 74.

RATIO OF THE SOLUBILITIES OF TOLUIC ACIDS (SEPARATELY DETERMINED)
IN WATER AND IN OLIVE OIL AT 25°.

(Boeseken and Waterman, 1911, 1912.)

The solubilities of each acid in water and in olive oil was separately determined and the ratio considered to correspond to the distribution coefficients in each case. The concentrations of the dissolved acids are not given.

Acid.	Ratio of $\frac{\text{Solubility in Olive Oil}}{\text{Solubility in Water}}$
<i>o</i> Toluic Acid	40.5
<i>m</i> " "	21
<i>p</i> " "	29.5

100 gms. 95% formic acid dissolve 2.99 gms. *o* toluic acid at 20.8°. (Aschan, 1913.)

SOLUBILITY OF ORTHO, META AND PARA TOLUIC ACIDS ($C_6H_4CH_3COOH$),
EACH SEPARATELY, IN ORTHO, META AND PARA XYLENE, AT 14°.

(Chapas, 1922.)

Each solvent was saturated with the given acid at the temperature of the water bath and the mixture allowed to cool to room temperature, while being agitated from time to time. The dissolved acid was determined by agitating a weighed amount of the saturated solution with an excess of 0.1 *N* Na OH and titrating with 0.1 *N* H Cl, using phenolphthalein as indicator.

100 gms. quinoline " 5.51 " " " " " " "

100 gms. equi. mol. mixture of alcohol and quinoline dissolve 64.30 gms. vanillin at 25°.

SOLUBILITY OF VANILLIN IN AQUEOUS SOLUTIONS OF GLYCEROL. (Mango and Ehler, 1924.)

The determinations could not be made at temperatures below 50° by the method used with alcohol solutions, due to the failure of vanillin to separate from the viscous glycerol mixtures, even on being supercooled by as much as 20°. An arbitrary method, which resembles the procedure used by flavor manufacturers in making vanillin solutions, was employed. This consisted in preparing, for each concentration of glycerol, a series of tubes in which different amounts of vanillin were dissolved by warming. These were kept at a nearly constant temperature (25° in one case and 13° in another) and shaken occasionally, during a period of one month. The mixtures which remained clear were seeded with a few crystals of vanillin in order to detect super saturation. Those which had been kept at 13° were nearly all supersaturated. The results were plotted and the following table was prepared. It shows the maximum amount of vanillin which will remain in solution under the usual conditions of preparing and storing commercial vanillin solutions.

Per cent Glycerol in solvent.	Gms. C ₈ H ₈ O ₃ .CH ₂ .OH. OH per 100 cc. solvent at		
	25°	13° without seeding	13° after seeding.

Hydroxy TOLUIC ACIDS

C₆H₃COOH.OH.CH₃, 1,2,3; 1,2,4; 1,2,5; 1,3,4 and 1,4,3.

SOLUBILITY OF EACH SEPARATELY IN WATER. (Sidgwick and Ewbank, 1921a.)

The determinations were made by the synthetic method and all details for accurate work were carefully observed. The results are expressed in wt. % that is, in grams of acid per 100 grams of saturated solution. L indicates that a second liquid layer separated. The position of the substituent groups in the several acids are numbered in the order, CO OH, OH and CH₃. Thus the 1, 2, 3 acid is C₆H₃.(1) CO OH.(2) OH.(3) CH₃, the 1,2,4 acid is C₆H₃.(1) CO OH.(2) OH.(4) CH₃, the 1, 2, 5 acid is C₆H₃.(1) CO OH.(2) OH.(5) CH₃, the 1, 3, 4 acid is C₆H₃.(1) CO OH.(3) OH.(4) CH₃ and the 1, 4, 3 acid is C₆H₃.(1) CO OH.(4) OH.(3) CH₃.

DI NITRO *p* XYLENES $(NO_2)_2C_6H_2(CH_3)_2$.

Freezing-point data for mixtures of 2.3 and 2.6 di nitro *p* xylenes are given by Blanksma, 1913.

Results for mixtures of 2.6 di nitro xylene and acenaphthene are given by Hertel and Kleu, 1930.

TRI NITRO ETHYL ANILINE 2,4,6- $(NO_2)_3C_6H_2NH.C_2H_5$.

100 gms. H_2O dissolve 0.010 gm. $C_8H_8O_6N_4$ at 19°, 0.031 gm. at 50° and 0.140 gm. at 100°. (Desvergues, 1926.)

NITROSO META XYLENE (4) $NOC_6H_3(CH_3)_2$.

Freezing-point data for mixtures of Nitroso meta xylene with *o* nitroso toluene and with nitroso mesitylene are given by Hammick, Edwards, Illingworth and Snell, 1933.

ACETANILIDE $C_6H_5NH.COCH_3$.

SOLUBILITY OF ACETANILIDE IN WATER. (Schoorl and de Weerd, 1922.)

SOLUBILITY OF ACETANILIDE IN AQUEOUS SOLUTIONS OF ACETIC ACID.
(Bradfield and Williams, 1929.)

The determinations were made by gradually heating mixtures of known weights of the solute and solvent and noting the temperature at which the last trace of solid disappeared. The results were plotted and the values for selected temperatures obtained from the curve.

AMINO ACETOPHENONE $CH_3COC_6H_4NH_2$.

Freezing-point data are given for mixtures of p amino aceto phenone and:

1.2.4 Chloro di nitro benzene (Giua, Marcellino and Curti, 1920);
Cinnamylidene aceto phenone (Giua, 1925); Tri nitro anisole (Giua, 1931); and 2.4.6-Tri nitro toluene (Giua, 1917.)

METHYL AMINO BENZOATE *m* and *p* $NH_2C_6H_4COOCH_3$.

Freezing-point data are given for mixtures of:

Methyl amino benzoates + Antipyrine (Pfeiffer and Seydel, 1928b.)

" " " + Pyramidon " " "

" " " + Sarcosine anhydride (Pfeiffer and Seydel, 1928b;)
and Pfeiffer, Angern and Wang, 1927.)

BROMO, CHLORO NITRO DI METHYL ANILINES $BrNO_2(CH_3)_2C_6H_4NH_2$.

Freezing-point data for mixtures of Bromo nitro di methyl anilines and for mixtures of Chloro nitro di methyl anilines are given by Clemo and Smith, 1928.

ANIS ALDOXIMES $CH_3OC_6H_4CH:NOH$.

Freezing-point data for mixtures of the cis and trans anis aldoximes are given by Skau and Saxton, 1933.

NITRO PHENETOL $NO_2C_6H_4OC_2H_5$.

Freezing-point data for mixtures of nitro phenetol with nitro

XYLENE $C_6H_4(CH_3)_2$.

SOLUBILITY OF XYLENE IN WATER.

The solubility of xylene in water is given by Horiba, 1917, as 0.018 but the isomer used, the temperature or the terms in which the result is expressed, are not defined.

Determinations of the solubility of xylene (Isomer?) in superheated water were made by Jaeger, 1923. A large shaking autoclave of more than two liters capacity was used. A measured volume of the saturated solution was cooled and after it had separated into two layers, the volume of xylene was measured.

t°	150°.	200°.	250°.
Gc. Xylene per 100 cc. H_2O	0.1	0.35	1.1

RECIPROCAL SOLUBILITY OF XYLENE AND WATER.

(Uspenski, 1929.)

t°	Gms. $C_6H_4(CH_3)_2$ per 100 gms. sat. sol. in H_2O	Gms. H_2O per 100 gms. sat. sol. in $C_6H_4(CH_3)_2$
10	0.0076	0.0185
25	0.0130	0.0384

100 gms. sat. solution of commercial xylene in 92 wt. per cent ethyl alcohol contain 83.4 gms. xylene at 15°.

(Ormandy and Craven, 1921.)

100 gms. sat. solution of *hexahydro xylene* in 92 wt. per cent ethyl alcohol contain 26.4 gms. of the compound at 15°.

(Ormandy and Craven, 1921.)

Results for the reciprocal solubility of Xylene and Sulfur are given by Hammick and Holt, 1927.

Freezing-point data for mixtures of *m* and *p* xylene are given by Nakatsuchi, 1926.

Freezing-point data are given for mixtures of Xylenes and:

Acetic acid(3)	Ethyl succinimide(3)
Benzene(2)(3)	Phenol(3)
Bromo toluene(3)	Resorcinol(1)
Ethyl bromide(3)	Toluene(2)
	Veratrole(3)

(1) Campetti, 1917; (2) Nakatsuchi, 1926; (3) Paterno and Ampola, 1897.

XYLENOL 1,3,4, $C_6H_3(CH_3)_2.OH$.

MISCIBILITY OF AQUEOUS ALKALINE SOLUTIONS OF XYLENOL WITH SEVERAL ORGANIC COMPOUNDS, INSOLUBLE IN WATER.

(Scheuble, 1907.)

To 5 cc. portions of aq. KOH solution (250 gms. per liter) were added the given amounts of the aq. insoluble compound from a buret and the xylenol, dropwise, until solution occurred. Temperature not stated.

Composition of Homogeneous Solution.

cc. Aq. KOH.	cc. Aq. Insol. Cmpd.	Gms. Xylenol.

44.70	32.85	30.65	82.01
47.75	41.72	19.65	85.99

Freezing-point data are given for mixtures of:

Octane and Dotriacontane (Diacetyl). $CH_3(CH_2)_{30}CH_3$, (Seyer, 1938.)

Octane and Nonane (Smittenberg, Hoog and Henkes, 1938.)

TETRA METHYL BUTANE 2,2,3,3- $CH_3C(CH_3)_2C(CH_3)_2CH_3$.

Freezing point data for mixtures of tetra methyl butane and tri methyl butane are given by Smittenberg, Hoog and Henkes, 1938.

TRI METHYL PENTANE 2,2,4- $CH_3C(CH_3)_2CHCH_3CH_2CH_3$.

Freezing-point data for mixtures of tri methyl pentane and heptane are given by Smittenberg, Hoog and Henkes, 1938.

2-METHYL HEPTANE $(CH_3)_2CH(CH_2)_4CH_3$.

The critical solution temperature of mixtures of 2-Methyl Heptane and Sulfur dioxide is 24° and the reciprocal solubility curve at this temperature is practically flat between the concentrations 50 and 90 Mol. % SO_2 . (Leslie, 1934.)

OCTYL ALCOHOL (normal) $CH_3(CH_2)_6CH_2OH$.

100 gms. sat. aqueous solution of normal octyl alcohol contain 0.0586 gm. $C_8H_{18}O$ at 25°. (Butler, Thomson and MacLennan, 1933.)

5.0 cc of aqueous saturated sodium benzoate solution dissolve 1.1 cc octyl alcohol at about 18°. (Traube, Schöning and Weber, 1927.)

OCTYL ALCOHOL (Secondary) $CH_3(CH_2)_5CHOH.CH_3$

By means of a new optical method, involving the use of an interferometer of the type described by Janin (*Ann. chim. phys.*, 82, 171, 1858), it was found that 1000 cc. of H_2O dissolve 1.508 gms. sec. octyl alcohol at 15° and 1.280 gms. at 25° (Mitchell, 1926.)

2,2,3-TRI METHYL PENTANOL-3 $(CH_3)_3C.COH(CH_3)CH_2CH_3$.

RECIPROCAL SOLUBILITY OF TRIMETHYL PENTANOL AND WATER.
(Ginnings and Coltrane, 1939.)

d. and B. pt. of the pure Tri methyl Pentanol		t°	Gms. $C_8H_{18}O$ per 100 gms. sat. sol. in H_2O	Gms. H_2O per 100 gms. sat. sol. in $C_8H_{18}O$

SOLUBILITY OF COUMARIN IN AQUEOUS SOLUTIONS OF GLYCEROL.

(de Groot, 1920.)

NOTE. - The glycerol solutions were prepared by diluting given volumes of C. P. grade 95 % glycerol with water in a 1000 cc. flask. Thus the 5 % glycerol was prepared by diluting 50 cc. of 95 % glycerol (measured at 20°) to 1000 cc. with water at 20°. The saturated solutions were prepared by adding an excess of coumarin to 500 cc. of solvent at a temperature about 10° higher than that of the determination, and then allowing to stand at the selected temperature, with intermittent shaking, for 72 hours. The saturated solutions were analyzed by extracting the coumarin with ether. The ethereal extract was evaporated and the residue dissolved in water and again extracted with ether. The residue of purified coumarin was dried at 30° and weighed. The curves given by the results are not as smooth as is desirable.

PHENYL METHYL FUROXIME $C_6H_5[(C_2N_2O)O]CH_3$.

Freezing-point data for mixtures of phenyl methyl furoxime and phenyl methyl dioxy diazine are given by Milone, 1929.

HYDROXY CINNAMIC ACID p (Coumaric Acid) $HOC_6H_4CH:CHCOOH$.

One liter sat. solution in water contains 1.307 gm. p Hydroxy cinnamic acid at 25°.

One liter sat. solution of allo p-Hydroxy cinnamic acid in water contains 3.94 gms. at 25°.
(Roth and Stoermer, 1913.)

β Phenyl DibromoPROPIONIC ACID C₉H₇Br₂(C₂H₅)COOH.

100 cc. sat. sol. in carbon tetrachloride contain 0.124 gm. acid at 26°. (De Jong, 1909.)

100 cc. sat. sol. in petroleum ether contain 0.072 gm. acid at 26°. "

η PHENYL VOLUNTAL (Phenyl carbaminic acid tri chlor ethyl ester)
CO(NHC₆H₅)OC₂H₂Cl₃.

Freezing-point data are given by Pfeiffer and Seydel, 1928(a) for mixtures of η Phenyl voluntal with acetyl amino antipyrine, antipyrine, pyramidon and with sarcosine anhydride.

Acetyl SALICYLIC ACID (Aspirin) CH₃COO.C₆H₄.COOH, 1,2.

SOLUBILITY AND MELTING-POINT CURVES FOR MIXTURES OF ACETYL SALICYLIC ACID AND WATER, DETERMINED BY THE SYNTHETIC METHOD.

100 gms. sat. solution in H_2O contain 2.408 gms. of the l acid at 20°. } 1900.)

METHYL ANISATE $CH_3OC_6H_4COOCH_3$.

Freezing-point data for mixtures of methyl anisate and tri chlor acetic acid are given by Kendall and Booge, 1916.

PROPIONANILIDE $C_6H_5.NH(C_2H_5O)$.

SOLUBILITY OF PROPIONANILIDE IN AQUEOUS ACETIC ACID SOLUTIONS.

(Bradfield and Williams, 1909.)

The determinations were made by gradually heating mixtures of known weights of solute and solvent and noting the temperature at which the last trace of solid disappeared. The results were plotted and the values for selected temperatures obtained from the curve.

SOLUBILITY OF *p* ACETOTOLUIDE IN AQUEOUS SOLUTIONS OF ETHYLALCOHOL
(Pleuger, 1923.)

The synthetic method of Alexejeff was used. Weighed amounts of the solvent and *p* Acetotoluide were sealed in small tubes and the temperature of complete solution determined. The individual determinations were plotted and the following results read from the curves.

Wt. per cent C_2H_5OH in solvent.	Gms. $CH_3CO.NH.C_6H_4.CH_3$ dissolved per 100 gms. sat. solution at

NITROSO MESITYLENE $NOC_6H_2(CH_3)_3$.

Freezing-point data are given by Hammick, Edwards, Illingworth and Suell, 1933, for mixtures of nitroso mesitylene with 4-nitroso m xylene, tri bromo nitroso benzene, o nitro nitroso benzene, o nitroso toluene, nitroso anisole and with nitroso benzene.

DI METHYL AMINO BENZOIC ACID $p(CH_3)_2NH_2C_6H_4COOH$.

Freezing-point data for mixtures of dimethyl amino benzoic acid and sarcosine anhydride are given by Pfeiffer, Angern and Wang, 1927.

PHENYL URETHAN (Carbanilic acid ethyl ester) $C_6H_5NHCOOC_2H_5$.

Freezing-point data for mixtures of phenyl urethan with pyramidon and with sarcosine anhydride are given by Pfeiffer and Seydel, 1928(a).

MethACETIN (p Acetanisidine, or p oxymethylacetanilide) $C_8H_9OCH_3$.
 $NHCH_3CO$.

100 gms. H_2O dissolve 0.19 gms. of the compound at 15° and 8.3 gms. at 100° .
(German Pharmacopoeia.)

 β PHENYL dl ALANINE $C_6H_5CH_2CH(NH_2)COOH$.**SOLUBILITY OF β PHENYL dl-ALANINE IN WATER.**

(Dutton and Schmidt, 1933.)

The following values were derived from a solubility equation calculated from a series of 20 very careful determinations at 10 different temperature between 0° and 75° .

t°	Gms. $C_9H_{11}O_2N$ per 1000 gms. H_2O	t°	Gms. $C_9H_{11}O_2N$ per 1000 gms. H_2O	t°	Gms. $C_9H_{11}O_2N$ per 1000 gms. H_2O
0	9.97 (10.09)	30	15.29 (60	26.71

SIMULTANEOUS SOLUBILITY OF *l* TYROSINE AND *dl* LEUCINE IN WATER AND IN AQUEOUS 0.01 NORMAL HYDROCHLORIC ACID AT 21°. (von Euler and Rudberg, 1921.)

Saturation was obtained by constant agitation of a large excess of the amino acids with the solvents in a thermostat. The saturated solutions were analyzed by a determination of total nitrogen and a colorimetric estimation of the tyrosin, by means of the xanthoprotein reaction in alkaline solution.

Solvent.	Gms. per liter of sat. sol.		Solid Phase.
	<i>l</i> Tyrosine.	<i>dl</i> Leucine.	
Water.....	0.338	9.87	<i>l</i> Tyrosine + <i>dl</i> Leucine
Aq. 0.01 <i>N</i> HCl ($p_H=1.74$)..	0.782	12.544	" "

The sat. solution in 0.01 *N* HCl had $p_H=2.93$.

SOLUBILITY OF TYROSINE IN AQUEOUS SOLUTIONS OF DIFFERENT HYDROGEN ION CONCENTRATION AT 23°. (Sano, 1926.)

The desired p_H concentration was secured with such acids and bases as form easily soluble salts with tyrosine. The solid phase in all cases was the amino acid. A large excess of tyrosine was shaken in a thermostat with the solvent and the saturated solution was analyzed by determination of the p_H with a hydrogen electrode, and the nitrogen by the micro Kjeldahl method, using iodometric titration according to Bang.

Solvent	p_H of sat. sol.	Gms. N per liter sat. sol.	Solvent.	p_H of sat. sol.	Gms. N per liter sat. sol.
0.1 <i>N</i> HCl + 0.9 <i>N</i> KCl	1.07	0.41400	0.32 mol. sec. phosphate + 0.0025 mol. prim. phosphate	7.41	0.04160

Nor CAMPHOR $C_{15}H_{24}O$.

One liter of water dissolves 1.93 gms. Norcamphor at 15-20° (Rhode, 1922). The author used a stalagmometric method involving an estimation of the number of drops per unit of time in the case of a saturated solution and its dilutions, in comparison with similar determinations upon a series of solutions of known content.

TRI ACETIN (Glycerol, tri acetate) $C_3H_5(OOCCH_3)_3$.

(Verkade and Geyde, Jr., 1902a.)

Methyl PELLETIERINE $\text{C}_9\text{H}_{17}\text{NO}$.

SOLUBILITY OF METHYLPELLETIERINE IN WATER. Table, 1920.

Methylpelletierine is soluble in cold water in all proportions but when the temperature is raised the solution becomes cloudy at a definite temperature for each concentration, and at sufficiently high concentrations the alkaloid separates as droplets. The following results were obtained by adding successively increasing amounts of water to 1.0 gm. of methylpelletierine and determining the temperature of clouding.

t° of clouding.	Gms. $\text{C}_9\text{H}_{17}\text{NO}$ per 100 gms. mixture.	t° of clouding.	Gms. $\text{C}_9\text{H}_{17}\text{NO}$ per 100 gms. mixture.	t° of clouding.	Gms. $\text{C}_9\text{H}_{17}\text{NO}$ per 100 gms. mixture.

HEXA HYDRO MESITYLENE (1,3,5-Tri methyl cyclohexane) $\text{C}_6\text{H}_9(\text{CH}_3)_3$.

The critical solution temperature of mixtures of hexa hydro mesitylene and liquid sulfur dioxide is 30.5° and the reciprocal solubility curve at this temperature is practically flat between the concentrations 40 and 95 mol. percent SO_2 . (Leslie, 1934.)

NONA NAPHTHENE (1,3,4-Tri methyl cyclohexane) $\text{C}_9\text{H}_9(\text{CH}_3)_3$.

The critical solution temperature of mixtures of nonanaphthene and liquid sulfur dioxide is 27° and the reciprocal solubility curve is practically flat between the concentrations 50 and 90 mol. percent SO_2 . (Leslie, 1934.)

DIBUTYL KETONE $(\text{C}_4\text{H}_9)_2\text{O}$.

1000 gms. H_2O dissolve 0.00357 gm. mols. $(\text{C}_4\text{H}_9)_2\text{O}$ at 10° , 0.00235 gm. mols. at 30° and 0.00243 gm. mols. at 50° as determined by analyzing the saturated solutions with the aid of a Zeiss interferometer. (Gross, Rintelen and Saylor, 1939.)

AMYL BUTYRATE $\text{C}_3\text{H}_7\text{COOC}_5\text{H}_{11}$.

100 cc H_2O dissolve 0.06 cc amyl butyrate at 20° .

(Traube, 1884; Bancroft, 1895.)

PELARGONIC ACID $\text{CH}_3(\text{CH}_2)_7\text{COOH}$.

Results showing the distribution of pelargonic acid between water and olive oil at 23° are given by Bodansky, 1928.

ETHYL OENANTHATE $CH_3(CH_2)_5COOC_2H_5$.

100 cc H_2O dissolve 0.029 gm. $CH_3(CH_2)_5COOC_2H_5$ at 20° .

(Sobotka and Kahn, 1931.)

NONANE $CH_3(CH_2)_7CH_3$.

The critical solution temperature of mixtures of nonane and liquid sulfur dioxide is 32° and the reciprocal solubility curve at this temperature is practically flat between the concentrations 60 and 95 mol. percent SO_2 . (Leslie, 1934.)

Freezing-point data for mixtures of nonane and octane are given by Smittenberg, Hoog and Henkes, 1938.

CARVOXIME $C_{10}H_{17}NOH$ *d*, *l* and *i*.

SOLUBILITY IN AQUEOUS ALCOHOL OF $d_{17.5} = 0.9125$ (51.6 PER CENT C_2H_5OH). (Goldschmidt and Cooper, 1898.)

The determinations were made by the synthetic method. On account of the slow rate at which melted carvoxime solidified on cooling below the melting point, in the tubes containing the synthetic mixtures, it was possible to obtain results which show the solubility curve for liquid carvoxime, in addition to the curves for dextro and inactive carvoxime. The curves for these latter intersect the curve for liquid carvoxime respectively at 51.7° , the m. pt. of dextro, and 70.5° the m.pt. of inactive carvoxime.

NAPHTHALENE $C_{10}H_8$.

By means of an optical method, involving the use of an interferometer of the type described by Jamin (*Ann. chim. phys.*, 52, 171, 1858), it was found that 1000 cc. of H_2O dissolve 0.022 gm. $C_{10}H_8$ at 15° and 0.040 gm. at 25°. (Mitchell, 1926.)

1000 cc. H_2O dissolve 0.019 gm. $C_{10}H_8$ at 0° and 0.030 gm. at 25° (Hilpert, 1916.)

Results for the aqueous solubility of the solid solution system Naphthalene- β Naphthol at 25°, 65° and 78° are given by Wright and Wallace, 1936.

SOLUBILITY OF NAPHTHALENE IN AQUEOUS SOLUTIONS OF FORMIC ACID. (Christiansen, 1918.)

NOTE. — The determinations were made by mixing together the several ingredients and, after a period of standing in a thermostat, estimating from the presence or absence of solid, the composition corresponding to a saturated solution. Constant agitation was not employed.

At the higher concentrations the amount of naphthalene which just dissolved was determined.

100 gms. 95% formic acid dissolve 0.30 gm. naphthalene at 18.5°. (Aschan, 1913.)

100 gms. 95% formic acid dissolve 3.44 gms. α -nitronaphthalene at 18.5°. "

Data for equilibrium in the systems: naphthalene, phenol, water and naphthalene, succinic acid nitrile, water, determined by the synthetic method, are given by Timmermans (1907).

EQUILIBRIUM IN THE SYSTEM NAPHTHALENE, ACETONE, WATER.

(Cady, 1898.)

An excess of naphthalene was added to each of a series of mixtures of water and acetone and the temperature determined at which a second liquid phase first appeared. Since an excess of naphthalene was present, the amount dissolved was not known. The following supplementary experiment was, therefore, required to ascertain the composition of the saturated solution in each case. "A weighed quantity of naphthalene was added to a known weight of the mixed liquids, the amount being just sufficient to cause the formation of two liquid phases. The consolute temperature of the system was then determined and the experiment repeated several times with different amounts of naphthalene. If the results are plotted, using the weights of naphthalene in a constant quantity of the mixed liquids as abscissas and the temperatures as ordinates, we shall get a series of curves. The composition of the liquid phase at the moment when the system passes from solid, solution and vapor to solid, two solutions and vapor is given by the point at which the prolongation of the curve for that particular mixture of acetone and water, cuts the ordinate for temperature at which the change takes place. This method requires no analysis and is of advantage in this case where ordinary quantitative analysis would be very difficult." Considerable difficulty was experienced in determining the consolute temperatures. It was necessary on account of the extreme volatility of the acetone to seal the mixtures in tubes.

The table of results, calculated with the aid of the determinations made as described above, is given on the following page.

TABLE SHOWING THE TEMPERATURES AT WHICH SOLUTIONS OF THE GIVEN COMPOSITIONS BEGIN TO SEPARATE INTO TWO LAYERS IN PRESENCE OF SOLID NAPHTHALENE.

(Cady, 1898)

(Calculated as described on preceding page)

t°.	Gms. per 100 Gms. Solution		
	Acetone.	Water.	Naphthalene.
65.5	10	89.92	0.08
53.3	19.91	80	0.09
45	29.92	69.67	0.41
38	40.81	58.22	0.97
32.2	48.67	48.68	2.65
28.5	57.43	36.64	5.93
28.2	60.43	25.75	13.82

The isotherms for intervals of 10° lie so close together that they are practically indistinguishable for the greater part of their length.

SOLUBILITY OF NAPHTHALENE IN AQUEOUS AMMONIA.

(Hilpert, 1916)

Solvent	Gms. C ₁₀ H ₈ per 1000 Gms. Solvent at	
	0°.	15°

SOLUBILITY OF NAPHTHALENE IN XYLENE.

(Rhodes and Eisenhauer, 1927.)

The temperatures of appearance of the first crystal and of disappearance of the last crystal in known mixtures of naphthalene and xylene were accurately determined and the mean taken as the temperature of solubility. The xylene was a mixture of *m* and *p* xylene practically free of *o* xylene.

100 gms. Methyl Formate dissolve 33.9 gms. Naphthalene at 25°. (Krober, 1919.)

100 gms. Para Gymene (b. pt. 176-176.5) dissolve 14.93 gms. Naphthalene at 30° (Wheeler, 1920.)

100 gms. Quinoline dissolve 3.02 gms. Naphthalene at 20-25° (Pucher and Dehu, 1921.)

100 gms. Equimol mixture of Quinoline and Ethyl alcohol dissolve 4.69 gms. naphthalene at 20-25°. (Pucher and Dehu, 1921.)

Data for the solubility and vapor pressures of naphthalene in (1) fresh wash oil (2) used oil after steam distillation and (3) still residues, are given by Hunte and Pippig, 1923. The results are of interest chiefly in the illuminating gas industry.

SOLUBILITY OF NAPHTHALENE IN TETRALIN AND IN OTHER SOLVENTS.

(Weissenberger, 1927.)

Results for:

SOLUBILITY OF NAPHTHALENE IN LIQUID CARBON DIOXIDE.
(Quinn, 1928a.)

The determinations were made in sealed tubes having two arms which permitted separating the saturated solution from the excess of $C_{10}H_8$. The volume of saturated solution was determined by graduations on the tube and the amount of $C_{10}H_8$ weighed after allowing the CO_2 to escape. The densities were determined in a specially designed tube.

SOLUBILITY OF α AND β NAPHTHYLAMINE SALTS OF NAPHTHALENE MONO AND DISULFONIC ACIDS, IN 0.01 NORMAL HYDROCHLORIC ACID. (Wales, 1922.)

The solutions were saturated by constant agitation in a thermostat for one day. Freshly prepared mixtures were used in all cases. The saturated solutions were analyzed by evaporation to dryness and weighing the residue. The author does not state clearly that 0.01 *N* HCl was used as solvent in all cases, but this is apparently the case since it is mentioned that the compounds hydrolyze in pure water and that 0.01 *N* HCl is necessary to prevent hydrolysis. Results are given for intervals of 5° between 25° and 98°.

The Ferrous salt of naphthalene β mono sulfonate crystallized with 6 H₂O. The solubility results are in terms of the anhydrous compound. The solubility curve for α naphthylamine salt of naphthalene β sulfonate shows a break at 54°, and that for the α naphthylamine salt of naphthalene α sulfonate shows a break at 66°.

NAPHTHALENE SULFONIC ACIDS.**SOLUBILITY OF BENZYL PSEUDO THIOUREA SALTS OF NAPHTHALENE MONO AND DISULFONIC ACIDS, IN 0.2 NORMAL HYDROCHLORIC ACID.**

(Chambers and Scherer, 1924.)

The experiments were made to obtain data upon which methods for the analytical separation of naphthalene sulfonic acids might be based.

Gms. compound per liter of sat. sol. in 0.2*N.* HCl.

Benzyl pseudo thio urea salt of Naphthalene :

The coefficient of distribution of β naphthylamine between benzene and water: at 25° is; conc. in C_6H_6 + conc. in H_2O = 279. The coefficient for α naphthylamine, similarly determined, is 252. (Farmer and Warth, 1904)

Results for equilibrium in the ternary system β -Naphthylamine + Resorcinol + Sulfur are given by Hrynakowski, Stanzewski and Smyt, 1917.

Freezing-point data are given for mixtures of Naphthylamines and:

Acetanilide(6)	Di nitro toluenes(17)(18)	Nitro benzene + Quinone(22)
Acetyl diphenyl(28)	Di nitro phenol(15)	Phenol(11)(13)

PHENYL PYRROLE C₁₀H₉N.

100 gms. sat. solution of phenyl pyrrole in liquid sulfur dioxide contain 15 gms. C₁₀H₉N at 7°. (De Carli, 1927.)

2-Amino-5 NAPHTHOL 1-SULFONIC ACID $C_{10}H_5(5)OH(2)NH_2(1)SO_3H$.
 1000 cc. cold water dissolve 2.12 gms. of the compound. The solubility of the potassium salt of the compound is about 94 grams per liter at 18°. (Bucherer and Wahl, 1921.)

NAPHTHYLAMINE Di SULFONIC ACIDS 2.6.8 and 2.5.7 $C_{10}H_5(NH_2)(SO_3H)_2$.

100 gms. sat. sol. of the 2.6.8 compound in water contain 9.24 gms. at 15°
 " " 2.5.7 " " 22.97 " (Braunschweig, 1928.)

1-NAPHTHYLAMINE, 2.4.7-Tri SULFONIC ACID $C_{10}H_4NH_2(SO_3H)_3$.

One liter sat. solution of 1 Naphthylamine, 2.4.7-Tri Sulfonic Acid in Water contain 184 gms. $C_{10}H_4NH_2(SO_3H)_3$ at 20° and 315 gms. at 80°. (Fritsch, 1930.) The author also gives results for the solubility of the Na, Ca, Ba and K salts of this acid in water at 20° and at 80°.

α } **NAPHTHYLAMINE HELIANTHATE** $C_{10}H_7NH_2 \cdot C_{14}H_{15}N_3SO_3$.

1000 cc. water dissolve 0.112 gm. of the α compound at 20-25° } (Stark and Dehn, 1918.)
 " " 0.101 " β " " " }

PHENYL TARTRIMIDE and Related Compounds.

SOLUBILITY OF EACH SEPARATELY IN WATER AND IN METHYL ALCOHOL.

PYRENE C₁₀H₁₀.

Freezing-point data are given by Shinomiya, 1940, for mixtures of Pyrene and each of the following compounds: Dinitro benzenes, dinitro phenol, dinitro toluene, picramide, picryl chloride, tetra nitro benzene tri nitro anisole, tri nitro benzene, tri nitro cresol, and tri nitro toluene.

DIHYDRO NAPHTHALENE C₁₀H₁₀.

Freezing-point data for mixtures of dihydro naphthalene and naphthalene are given by Küster, 1891.

NAPHTHYLENE DIAMINE C₁₀H₈(NH₂)₂.

Freezing-point data for mixtures of naphthalene diamine and o cresol are given by Puschin and Sladovic, 1928.

BENZAL ACETONE C₆H₅CH:CHCOCH₃.

Freezing-point data are given by Pfeiffer, Goebel, and Angera, 1925, for mixtures of Benzal acetone and each of the following compounds: Acenaphthene, Naphthylamine, Nerolin, Nitraniline and Tetra methyl diamino dibenzal acetone.

BENZOYL ACETONE C₆H₅COCH₂COCH₃.

100 gms. sat. solution of benzoyl acetone in liquid sulfur dioxide contain about 43 gms. C₆H₅COCH₂COCH₃ at 7 °C. (McCarl, 1927.)

METHYL CINNAMIC ACID C₆H₅C(CH₃):CHCOOH.

SOLUBILITY OF SEVERAL ALKYL CINNAMIC ACIDS IN BENZENE AND IN PETROLEUM ETHER. (Stoermer, Grimm and Laage, 1917.)

METHYL CINNAMATE $C_6H_5CH=CHCOCH_3$.

The critical solution temperature of mixtures of methyl cinnamate and iso amyl benzoate is 19.8° . (Ilecat, 1928.)

Freezing point data for mixtures of methyl cinnamate with chloro acetic acid and tri chloro acetic acid are given by Kendall and Booge, 1916.

METHYL PHENYL TRICHLORO ETHYL CARBAMATE $CO(NCH_3.C_6H_5)(OC_2H_2Cl_3)$.

Freezing point data for mixtures of p Methyl phenyl voluntal with acetyl amino antipyrine, with antipyrine and with sarcosine anhydride are given by Pfeiffer and Seydel, 1928A.

METHOXY CINNAMIC ACID $p-CH_3O.C_6H_4CH=CHCOOH$.

One liter sat. solution of p methoxy cinnamic acid in water contains 0.0712 gm. $CH_3O.C_6H_4CH=CHCOOH$ at 25° .

One liter sat. solution of allo p methoxy cinnamic acid in water contains 1.966 gm. at 25° . (Roth and Stoermer, 1913.)

Freezing point data are given for:

p Methoxy Cinnamic acid + Azoxyphenetol (Prins, 1909.)
 " " " + p Azoxyanisole (de Kock, 1904.)
 " " " + Hydroquinone " "

p METHOXY PHENYL FUROXIME $CH_3O.C_6H_4[OC_2N_2O]CH_3$.

Freezing point data for mixtures of p methoxy phenyl furoxime and methoxy phenyl methyl dioxy diazine are given by Milone, 1929.

METHYL CUMARIC ACID $C_{10}H_{10}O_3$.

One liter sat. solution in water contains 0.084 gm. methylcumaric acid at 25° . (Roth and Stoermer, 1911.)

METHYL CUMARINIC ACID $C_{12}H_{12}O_3$.

One liter sat. solution in water contains 0.712 gms. methyl cumarinic acid at 25° . (Roth and Stoermer, 1911.)

DIMETHYL TEREPHTHALATE $C_6H_4(COOCH_3)_2$.

Freezing point data for mixtures of dimethyl terephthalate and tri chloroacetic acid are given by Kendall and Booge, 1916.)

CREATININE PICRATE $C_4H_7N_3O.OHC_6H_4(NO_2)_3$.

100 gms. sat. solution in water contain 0.112 gm. picrate at $7^\circ.5$, 0.182 gm. at 21° , 0.261 gm. at 31.5° , 0.416 gm. at 48.6° , 1.035 gm. at 78° and 1.572 gm. at 92° .

100 gms. sat. solution in 24.5% ethyl alcohol contain 0.224 gm. picrate at 8° , 0.362 gm. at 19° , 0.751 gm. at 47° , 1.718 gm. at 57° and 3.16 gm. at 74° . (Medes, 1925-1926.)

n- α -DIMETHYL INDOLE $(CH_3)_2NCH_2CH_2H$.

Freezing point data for mixtures of *n*- α -dimethyl indole and sarcosine anhydride are given by Pfeiffer, Angern and Wang, 1927.

***p* Acetoxy ACETANILIDE**, $CH_3CO_2OC_6H_4NHCOCH_3$, *p*.

100 cc. of sat. solution in water contain 0.239 gms. $CH_3CO_2OC_6H_4NHCOCH_3$ at 25°.
100 cc of sat. solution in chloroform contain 3.25 gms.

(Emery and Wright, 1921.)

Data for the distribution of *p* acetoxyacetanilide between water and chloroform are also given by Emery and Wright, 1921.

ANETHOLE (*p* Propylanisole) $CH_3CHCH[4]C_6H_4OCH_3$.

SOLUBILITY IN AQUEOUS ALCOHOL AT 20°

(Schimmel and Co., Reports, Oct. 1895, p. 6.)

Vol. per cent alcohol =	20	25	30	40	50
Gm. anethole per liter aq. alcohol =	0.12	0.20	0.32	0.86	1.30
333.3 gms. anethole dissolve in one liter of 90% alcohol at room temperature					

(Squire and Cairns, 1901.)

Freezing-point data for mixtures of anethole and menthol are given by Scheuer (1910).

CUMINIC ACID $C_3H_7C_6H_4COOH$ (*p* Isopropyl Benzoic Acid).

SOLUBILITY IN WATER AT 25°. (Paul, 1891.)

1000 cc. sat. solution contain 0.1519 gm. or 0.026 millimol cuminic acid.

TETRALIN (1, 2, 3, 4-Tetrahydro Naphthalene) $C_{10}H_{12}$.

SOLUBILITY OF TETRALIN IN SUPER-HEATED WATER. (Jaeger, 1926.)

The determinations were made in a large shaking autoclave. The air in the autoclave was previously displaced and mixtures of 500 cc. of the hydrocarbon and 2 liters of water were introduced and shaken 10 minutes at each temperature and allowed to stand 20 minutes. 500 cc. of the solution were withdrawn and after allowing about a day for the separation of the two layers the volume of the upper floating layer was carefully measured.

	2°	10°	20°	30°
Cc. $C_{10}H_{12}$ dissolved per 100 cc. H_2O .	0.02 (0.02)	0.04 (0.04)	0.09 (0.09)	0.16 (0.15-0.20)

Experiments made with various samples of hydrocarbons from generator tar, gas flame coal tar, etc., gave results (shown in parentheses) agreeing quite closely with those for tetralin.

ALLYL PHENYL THIO UREA $(NHC_3H_5)(NHC_6H_5)CS$.SOLUBILITY OF ALLYL PHENYL THIOUREA IN SEVERAL SOLVENTS.

TETRA METHYL BENZENES (Durene and Tolu-durene) $C_6H_2(CH_3)_4$.

Freezing-point data for mixtures of durene and tolu-durene are given by Smith and Mac Dougall, 1929.

NICOTINE $C_{10}H_{14}N_2$.**SOLUBILITY IN WATER.**

(Hudson, 1924)

Determinations made by Synthetic Method, for which see Note, page 16. Below 60° and above 210° both liquids are miscible in all proportions; likewise with percentages of nicotine less than 6.8 and above 82 per cent the liquid does not show two layers at any temperature. Below 94° the upper layer is water. Above 94° the upper layer is nicotine. The curve plotted from the following results makes a complete circle.

Percentage of Nicotine in the Mixture	Temperature of Appearance of Two Layers Degrees C.	Temperature of Homogeneity Degrees C.
6.8	94	95
7.8	86	155
10.0	75	...
14.8	65	200
32.2	61	210
49.0	64	205
66.8	72	190
80.2	87	170
82.0	120	130

Additional data for the above system are given by Tsakalotos (1900). The values for the temperatures of saturation are in general, from 1° to 5° lower than those of Hudson.

The temperature of clouding of various mixtures of nicotine and aqueous solutions of sodium hydroxide, sodium sulfate and hydrochloric acid was determined by Dubrisay, 1922. The results were used in the study of certain reactions. When plotted, a change in direction of the curve was found to occur at the point of neutralization. The presence of acids, bases and salts was shown to modify considerably the miscibility of liquid pairs.

The formation of hydrates of nicotine and their decomposition at higher temperatures is suggested by Jephcott, 1919, as the explanation of the true nature of the "closed curve of solubility."

Results for the effect of various salts and organic acids upon the interfacial tension by the drop method and the critical mixing temperature (60.9°) of nicotine and water are given by Smeentschenko and Davidoffskaja, 1934. Results for the effect of deuterium upon the lower critical solution temperature of nicotine-water mixtures are given by Hall, Wentzel and Smith, 1934.

Results in the form of curves, showing the decreasing solubility of nicotine in water caused by increasing amounts of various salts at 50° , and the effect of increasing amounts of various acids at 50° , are given by Jephcott, 1919.

NICOTINE SILICO TUNGSTATE $2C_{10}H_{14}N_2 \cdot SiO_2 \cdot 12WO_3 \cdot 2H_2O$.

SOLUBILITY OF NICOTINE SILICOTUNGSTATE IN AQUEOUS
HYDROCHLORIC ACID AT 25° .

(Spies, 1936.)

The saturated solutions were prepared by constant stirring and approaching equilibrium both from above and from below. The saturated solutions were analyzed by evaporating in a platinum dish and igniting the residue.

SOLUBILITY OF THYMOL IN WATER.

By means of a stalagmometric method (see Carvone, p. 676) the solubility of thymol in water was found by Rhode, 1922, to be 5.7 millimols, or 0.876 gms., per liter at $15-20^\circ$.

Approximate determinations of the solubility of thymol in water made by analysis of the saturated solution (temperature of saturation not stated) and by measuring its freezing-point gave, respectively, 0.78 and 1.11 gm. thymol per liter. (Vladesco, 1922.)

RECIPROCAL SOLUBILITY OF THYMOL AND WATER.

(Wilcox and Bailey, 1929.)

The determinations were made partly by thermal analysis and partly (for co-existing liquids) by the synthetic method.

t°	Gms. $C_{10}H_{13}OH$ per 100 gms. sat. sol.	Solid Phase	t°	Gms. $C_{10}H_{13}OH$ per 100 gms. sat. sol.	Solid Phase

CARVONE C₁₀H₁₄O, **CARVENONE** C₁₀H₁₄O, etc.

SOLUBILITY OF EACH COMPOUND SEPARATELY IN WATER AT 15-20°,
DEB. 1912

The determinations were made by a stalagmometric method in which the number of drops per unit of time in the case of saturated solutions and their dilutions were compared with the number of drops per unit of time found for solutions of known content. For obtaining saturation long periods of shaking were often necessary. The attainment of saturation was controlled by stalagmometric measurements.

Compound	Structure	Millimoles per liter of saturated

α Di chlor hydride	43.3	63.5
Methanol	-64.0	9.0
Methyl malonate	54.5	78.0

Freezing point data for mixtures of d and l pinene are given by Ross and Sommerville, 1926.

PINENE HYDROCHLORIDE $C_{10}H_{16}.HCl$.

100 gms. 95% formic acid dissolve 1.2 gms. $C_{10}H_{16}.HCl$ at 16.8°. (Aschan, 1913.)

Freezing-point data for mixtures of pinene hydrochloride and l borneol are given by Timmermans, 1930.

CAMPHENE C₁₀H₁₆.

Freezing-point data are given for mixtures of:

Camphene(d) + Camphene (l) (Ross and Sommerville, 1926.)			
" + Camphor	"	"	"
" + Tri chlor acetic acid (Timofeev and Kravtsov, 1918, 1917.)			
" + Methyl mustard oil (Kurnakov and Jeffreew, 1912.)			
" + Naphthalene	"	"	"
" + Phenanthrene	"	"	"
" + Benzene	"	"	"

FENCHONE d C₁₀H₁₆O.

Freezing-point data are given by Kremann and Dietrich, 1923, for mixtures of fenchone and each of the following compounds:

Di nitro phenol, hydroquinone, naphthols, nitro phenols, phenol, picric acid, pyrocatechol, pyrogallol and resorcinol.

CAMPHOR C₁₀H₁₆O.

SOLUBILITY OF CAMPHOR IN WATER AND IN AQUEOUS SOLUTIONS.

(Leo and Rimbach, 1919.)

Solvent.	t°.	Gms. C ₁₀ H ₁₆ O per 100 gms. sat. sol.	Solvent.	t°.	Gms. C ₁₀ H ₁₆ O per 100 gms. sat. sol.
Water..	14-17	0.167 α	Ringer's solution	14-17	0.167 α , 0.171 α , 0.204 β
" ..	15-20	0.170 (Rhode, 1912.)	" ..	35.5	0.140 α
" ..	39	0.160 α	" + 2% C ₂ H ₅ OH	14-17	0.248 β
			" + 2% I ₂	14-17	0.270 β

α . These determinations were made by shaking with just sufficient excess of active camphor to almost completely dissolve, and also by titrating the saturated solution with 0.1n KMnO₄ solution.

β . In these cases a weighed amount of active camphor was shaken at room temperature with one liter of solvent for 24 hours. The undissolved camphor then filtered off, dissolved in 50 cc of 95% C₂H₅OH and from the rotation of the solution, the undissolved camphor was calculated.

γ . In these cases 300 cc. of the saturated aqueous solution were extracted with 60 cc. of benzene and the camphor in this determined by the optical method. The determination by Rhode was made by use of a stalagmometric method for estimating the dissolved camphor. (See Norcamphor, page 643 and Carvone, p. 674.)

APPROXIMATE SOLUBILITY OF d CAMPHOR IN SEVERAL SOLVENTS AT ORDINARY TEMPERATURE. (U. S. P., Squires, Greenish and Smith, 1903.)

Solvent.	Parts Camphor per 100 Parts Solvent	Solvent.	Parts Camphor per 100 Parts Solvent
Water	0.08-0.14	Chloroform	300-400
90% Alcohol	100	Olive Oil	25-33
95% Alcohol	125	Turpentine	66
Ether	173	Glacial Acetic Acid	200
Carbon Disulfide	Readily Soluble	Lanolin	12.5 (Klose 1907).

Saturated solutions of d camphor and of l camphor in turpentine of $\alpha_D = +3.38$ (in a 10 cm. tube at 18°) were found to have $d_{40} = 0.9028$ and 0.9030 respectively; the α_D in a 10 cm. tube were $+23.07$ and -16.52 respectively. (Jones, 1907 68.)

SOLUBILITY OF CAMPHOR IN CONCENTRATED AQUEOUS HYDROCHLORIC
ACID. (Zaharia, 1899.)

(The dissolved camphor could not be determined by evaporating and weighing the residue on account of volatility; polarimetric methods could not be used on account of the interference of the HCl. The author, therefore, determined the densities (H_2O at 4° in each case) of the pure solvent and saturated solution in each case, and assumed that the difference represented the weight of camphor dissolved. The saturated solutions were prepared by stirring the several mixtures with a glass stirring rod, at intervals, during 6 hours.)

(1) Timofeev (1914); (2) Beilstein; (3) Seidell (1910); (4) Aschan, (1913).

Data for the distribution of camphoric acid between water and ether at 25° are given by Chandler (1908). Data for the freezing points of mixtures of *d* and *l* camphoric acid and *d* and *l* isocamphoric acid are given by Centnerszwer (1899).

Results for mixtures of stereo isomeric camphoric acids, camphoric acid methyl esters and camphoric anhydrides are given by Ross and Sommerville, 1926.

CYMENE DISULFONAMIDE $C_{10}H_{12}(SO_2.NH_2)_2$.

100 gms. of ether dissolve 0.0727 gm. cyment disulfonamide at 25°. (Phillips, 1924.)

This author also gives f. pt. data for the system α cyment sulfonamide + β cyment sulfonamide.

CAMPHOROXIME $C_{10}H_{16}.NOH$ *d* and *l*.

100 gms. turpentine dissolve 8.68 gms. *d* oxime at 18°, $d_{18} = 0.8784$, $\alpha_D = 2.30$ in 10 cm. tube.

100 gms. turpentine dissolve 8.69 gms. *l* oxime at 18°, $d_{18} = 0.8782$, $\alpha_D = 18.24$ in 10 cm. tube.

α_D of the turpentine = 4.38 in a 10 cm. tube at 18°.

In the case of results in *l* amyl bromide the $d_{18} = 1.199$ in both cases and the α_D was -3.55 (10 cm. tube) for the *d* oxime and +11.48 for the *l* oxime. The α_D of the amyl bromide was +4.6 in 10 cm. tube at 18°. The results show that the solubility and rotatory power of the *d* and *l* isomerides are identical in an optically active as well as in an inactive solvent.

Freezing-point data are given for mixtures of *d* and *l* camphoroxime by Beck (1904) and Adriani (1900).

DECALIN (Decahydronaphthalene) $C_{10}H_{18}$.SOLUBILITY IN LIQUID SULFUR DIOXIDE (98.85% SO_2).

(Zerner, Weisz and Opalski, 1922.)

The determinations were made in sealed resistance glass tubes. Weighed amounts of the constituents were introduced and the temperatures determined at which homogeneous mixing or slight clouding occurred. The Decalin had a corrected

b. pt. of 188-189°. It had $d_{20} = 0.8857$ and $n_D^{15} = 1.4753$.

TERPINEOL $\alpha C_{10}H_{18}O$ and $\beta C_{10}H_{18}O$.SOLUBILITY OF α TERPINEOL AND OF β TERPINEOL IN WATER. (Rhode, 1922.)

By means of a stalagmometric method (see Carvone, p. 676) the solubility of α terpineol in water was found to be 1.98 gms. (= 0.0129 mols.) per liter at 15-20°. The result for β terpineol was 2.20 gms. (= 0.0143 mols.) per liter at 15-20°.

MENTHONE $C_{10}H_{18}O$.

Freezing-point data for mixtures of menthone and menthole are given by Vanstone, 1909.

BORNEOL $C_{10}H_{17}OH$.

SOLUBILITY OF BORNEOL IN WATER

Using a stalagmometric method involving a comparison of the number of drops per unit of time in the case of saturated solutions and their dilutions, in comparison with similar determinations upon a series of solutions of known content, Rhode, 1922, found that 1 liter of H_2O dissolves 0.64 gm. (= 4.2 millimols.) borneol at 15-20°.

By means of an optical method in which an interferometer of the type described by Jamin (*Ann. chim. phys.*, 52, 171, 1858) was used, Mitchell, 1926, found that 1 liter of H_2O dissolves 0.69 gm. borneol at 15° and 0.740 gm. at 25°.

100 gms. abs. alcohol dissolve 175.5 gms. borneol at 20-25° (Fischer and Dehn, 1921.)

Freezing-point lowering data for mixtures of *d* borneol and *l* borneol, *d* borneol and *d* camphor, *d* bornyl hydrogen phthalate and *l* bornyl hydrogen phthalate are given by Ross and Somerville, 1926.

Freezing-point data for mixtures of stereoisomeric Borneols and each of the following stereoisomeric compounds are given by Timmermans, 1940. Bromo camphor, chloro camphor, camphor and pinene hydrochloride.

Results for mixtures of Borneol and camphor are also given by Vanstone, 1909, and Hrynakowski, Staszewski and Szmyt, 1946.

CINEOLE (Eucalyptol) $C_{10}H_{18}O$.

Freezing-point data for mixtures of d and l iso menthol are given by Read, Robertson and Cook, 1927.

ETHYL CAPRYLATE $CH_3(CH_2)_6COOC_2H_5$.

100 cc H_2O dissolve 0.007 gm. $CH_3(CH_2)_6COOC_2H_5$ at 20° (Sobotka and Kahn, 1931.)

TRI CAPRIN $C_5H_5[CH_3(CH_2)_8COO]_3$.**SOLUBILITY OF TRI CAPRIN IN SEVERAL SOLVENTS.**

(Loskit, 1928.)

The determinations were made by the thermic, the sealed tube and the analytical method. The author's results were plotted and the following table constructed from the curves.

t°	Gms. $C_5H_5[CH_3(CH_2)_8COO]_3$ per 100 gms. sat. sol. in:			t°	Gms. $C_5H_5[CH_3(CH_2)_8COO]_3$ per 100 gms. sat. sol. in:		
	C_6H_6	$(C_2H_5)_2O$	CS_2		C_6H_6	$(C_2H_5)_2O$	CS_2

TERPIN HYDRATE $C_{10}H_{18}(OH)_2 \cdot H_2O$.

100 cc. H_2O dissolve 0.36 gm. terpin hydrate at $15-20^\circ$.

100 cc. 90% alcohol dissolve 7.1 gms. terpin hydrate at $15-20^\circ$.
(Squire and Caines, 1905.)

Freezing-point data for mixtures of terpin hydrate and salol are given by Angeletti, 1928.

DECANE $CH_3(CH_2)_8CH_3$.

The critical solution temperature of mixtures of decane and liquid sulfur dioxide is 36.5° and the reciprocal solubility curve at this temperature is practically flat between the concentrations 60-90 mol. percent SO_2 . (Leslie, 1934.) The C.S.T. is given by Seyer and Todd, 1931, as 37.3° .

Freezing-point data for mixtures of decane and dicetyl are given by Seyer, 1938.

686

AGARIC ACID $C_{10}H_{10}O_4 \cdot H_2O$.

100 grams trichloroethylene dissolve 0.014 gram agaric acid at 15°.

(Wester and Bruins, 1914.)

β NAPHTHOIC ACID $C_{10}H_7COOH$.

One liter of aqueous solution contains 0.058 gm. $C_{10}H_7COOH$ at 25°.

(Paul, 1894.)

Freezing-point data for mixtures of α Naphthoic acid and tetra methyl diamino benzo phenone are given by Pfeiffer, Goebel and Angern, 1925.

β METHYL NAPHTHALENE $C_{10}H_7(CH_3)$.

Freezing-point data for mixtures of β methyl naphthalene with β naphthol, with β naphthylamine and with β chloro naphthalene are given by Grimm, Gunther and Titus, 1931.

Dihydro β NAPHTHOIC ACIDS $C_{10}H_8COOH$ (118° and 161° isomers).

SOLUBILITY OF EACH ISOMER, DETERMINED SEPARATELY, IN WATER.
(Derick and Kamm, 1916)

(11)

SOLUBILITY IN XYLOL AT 20° F. (Data from U. S. P. VIII)

An excess of *d*-camphocarbonic acid was shaken in a 100-cc. flask with 25 cc. of xylol for 15 minutes. To remove the clear solution, 5 gm. of 50% NaOH were added and the mixture shaken 5 minutes, centrifuged 15 minutes, and the clear caustic solution layer poured in a 1 dm. tube. The acid was 99.99% corresponding to 0.1827 gm. of the acid per 100 cc. xylol solution. The average of several determinations gave 0.16 gm. $\text{C}_{10}\text{H}_{14}$ $\text{CH}(\text{COOH})_2$ per 100 cc. solution in xylol at 20° F.

Freezing point data for mixtures of d and l formyl neomenthyl amines are given by Read and Steele, 1927.

UNDECYLIC (Hendecanoic) ACID $\text{CH}_3(\text{CH}_2)_9\text{COOH}$.

Freezing point data for mixtures of undecylic and lauric acids are given by Kulka and Sandin, 1937.

UNDECANE (Hendecane) $\text{CH}_3(\text{CH}_2)_9\text{CH}_3$.

The critical solution temperature of mixtures of undecane and liquid sulfur dioxide is 42° and the reciprocal solubility curve at this temperature is practically flat between 65 and 95 mol. percent SO_2 .

(Leslie, 1934.)

BROM UNDECAN ACIDS $CH_3Br(CH_2)_9COOH$.

Freezing-point data for mixtures of 10- and 11 Brom undecan acids are given by Ashton and Smith, 1934.

ETHYL PELARGONATE $(CH_3)_7(CH_2)_7COOC_2H_5$.

100 cc H_2O dissolve 0.003 gm. $CH_3(CH_2)_7COOC_2H_5$ at 20° .
(Sobotka and Kahn, 1931.)

BENZINE (Petroleum) $C_6H_{12}C_6H_{14}$.

100 parts of alcohol dissolve about 16 parts benzine of 0.638-0.660 Sp. Gr., at 25° .

HEXA NITRO DIPHENYL AMINE $(NO_2)_2C_6H_4NHC_6H_4(NO_2)_2$.

SOLUBILITY OF HEXANITRO DIPHENYL AMINE IN SEVERAL SOLVENTS.
(Desvergues, 1925.)

BIPHENYL, DIBROMO and DICHLORO $C_6H_4BrC_6H_4Br$, $C_6H_4ClC_6H_4Cl$.

Freezing-point data are given for mixtures of:

Dibromo biphenyl	+	Di fluoro biphenyl	(Roselius, 1933.)
"	"	+ Biphenyl	"
Dichloro biphenyl	+	Biphenol	(Grimm, Gunther and Titus, 1931.)
"	"	+ Bitolyl	"
"	"	+ Benzidine	"

BIPHENYLENE OXIDE (Dibenzo furan) $C_{12}H_8O$.

Freezing-point data are given by Cullinane and Plummer, 1938, for the following mixtures:

Diphenylene oxide	+	diphenylene sulfide
"	+	" selenide
Diphenylene dioxide	+	diphenylene sulfide
"	+	" selenide
Diphenylene sulfide	+	diphenylene selenide
" disulfide	+	" diselenide

BIPHENYL 4-BROMO, CHLORO etc. $C_6H_5C_6H_4Br$.

Freezing-point data are given by Klemm, Klemm and Schiemann, 1933, for mixtures of:

Bromo biphenyl	+	Chloro biphenyl
"	+	Biphenyl
"	+	Fluoro biphenyl
Chloro biphenyl	+	Biphenyl
"	+	Fluoro biphenyl
Fluoro biphenyl	+	Biphenyl

BIPHENYL p IODO $C_6H_5C_6H_4I$.

Freezing point data are given by Pfeiffer, Schmitz and Inoue, 1929, for mixtures of Iodo diphenyl and each of the following compounds: Dianisal acetone, dipiperonal acetone, menthol, α naphthol, α naphthylamine, piperonal aceto phenone, sarcosine anhydride, tri nitro benzene.

BROMO (Chloro, Iodo) ACENAPHTHENE $C_{10}H_5Br(CH_2)_2$.

Freezing point data for mixtures of Bromo, Chloro and Iodo acenaphthenes are given by Crompton and Walker, 1912.

CARBAZOLE (Diphenylene imide) $(C_6H_5)_2NH$.

100 grams abs. alcohol dissolve 0.92 gm. $(C_6H_5)_2NH$ at 14° , and 3.88 gms. at b. pt.
100 gms. toluene dissolve 0.55 gm. $(C_6H_5)_2NH$ at 16.5° , and 5.46 gms. at b. pt.

CARBAZOLE (C₆H₄)₂NH.100 gms. abs. Alcohol dissolve 1.30 gms. (C₆H₄)₂NH at 60°-65°. (Fischer and Dehn, 1921.)

" Quinoline " 33.50 " " " "

" Equi. molecular Mixture of Alcohol and Quinoline dissolve 9.86 gms. (C₆H₄)₂NH at 60°-75°. (Fischer and Dehn, 1921.)

SOLUBILITY OF CARBAZOLE IN VARIOUS ORGANIC SOLVENTS. (Calk, 1912.)

CHLORO DIPHENYL AMINE $p\text{-ClC}_6\text{H}_4\text{NH}_2$

Freezing point data are given by Chauman and Perrott, 1930, for mixtures of *p*-chloro diphenyl amine with diphenyl amine and with *o*-chloro phenyl amine.

DI PHENYL DI SULFIDE $(\text{C}_6\text{H}_5)_2\text{S}_2$

Freezing-point data are given by Grice, Gunther and Litton, 1911, for mixtures of diphenyl disulfide and dibenzyl. (Results for mixtures of diphenyl sulfide, selenide, telluride and diphenyl ether are given by Pascal, 1912.)

PHENYL ETHER $(\text{C}_6\text{H}_5)_2\text{O}$

The critical solution temperature of a mixture of phenyl ether and iso amyl benzoate is 23.5°. (Lecat, 1928.)

Freezing point data for mixtures of phenyl ether with diphenyl methane and with diphenyl amine are given by Grice, Gunther and Litton, 1911.

Results for mixtures of Phenyl ether and tri nitro benzene are given by Sudborough and Beard, 1911.

HydroxyAZOBENZENE $\text{C}_6\text{H}_5\text{N}:\text{N.C}_6\text{H}_4\text{OH}$

1000 cc. sat. solution in H_2O contain 0.0225 gm. $\text{C}_6\text{H}_5\text{N}:\text{N.C}_6\text{H}_4\text{OH}$ at 25°.

1000 cc. sat. solution in H_2O sat. with C_6H_6 contain 0.0284 gm. $\text{C}_6\text{H}_5\text{N}:\text{N.C}_6\text{H}_4\text{OH}$ at 25°.

1000 cc. sat. solution in C_6H_6 sat. with H_2O contain 15.20 gms. $\text{C}_6\text{H}_5\text{N}:\text{N.C}_6\text{H}_4\text{OH}$ at 25°.

Distribution results for hydroxyazobenzene between benzene and water gave: conc. in $\text{C}_6\text{H}_6 \div$ conc. in $\text{H}_2\text{O} = 539$ at 25°.

(Farmer, 1901)

(Farmer, 1901)

Freezing-point data for mixtures of oxyazobenzene with amino azobenzene and with chloro azobenzene are given by Grice, Gunther and Thompson.

AZOXY BENZENE $C_6H_5(NON)C_6H_5$.

Freezing-point data for mixtures of azoxy benzene with bromo dinitro benzene, with dinitro toluene and with trinitro toluenes are given by Givà and Guastella, 1925.

BIPHENOL $HOC_6H_4.C_6H_4OH$.

Freezing-point data for mixtures of biphenol with benzidine with di tolyl and with dichloro diphenyl are given by Grimm, Gunther and Titus, 1931

NAPHTHYL ACETATE $CH_3COOC_{10}H_7$.

Freezing-point data are given for

α and β Naphthyl acetates + Acetic acid (Kendall and Booge, 1916.)

β Naphthyl acetate + Picric acid (Shinomiya, 1940.)

" " + Tri nitro benzene " "

" " + Tetra nitro benzene " "

METHYL NAPHTHOATE $\beta C_{10}H_7COOCH_3$.

Freezing-point data are given by Shimomiya, 1940 for mixtures of β methyl naphthoate with picric acid with trinitro benzene and with tetra nitro benzene.

BENZOIC ANHYDRIDE $(C_6H_5CO)_2O$.

Freezing-point data are given for mixtures of benzoic anhydride and sulfuric acid by Kendall and Carpenter (1914).

METHYL ORANGE $H_2NC_6H_4.N_2.C_6H_4SO_3Na$.

QUINHYDRONE C₆H₄O₂·C₆H₄(OH)₂.

Data for the solubility and dissociation of quinhydrone in water at 25° are given by Luther and Leubner, 1912. Later experiments at 15°, 25° and 35° are reported by Berthoud and Kunz, 1938. These latter authors describe the difficulties of reaching equilibrium, both from above and from below, and found it necessary to use 0.001 n HCl as solvent instead of water in order to avoid persistent colloidal opalescence in the solutions. They give the following results for the solubility of quinhydrone in water (0.001 n HCl) and in aqueous solutions of hydroquinone.

Gm. Mol. Hydroquinone per liter aq. solvent	Gm. Mol. Quinhydrone per liter sat. sol. at:		
	15°	25°	35°
0.0 (= 0.001 n HCl)	0.01224	0.01870	0.02788

ANILINE BENZENE MONO SULFONATE etc. $C_6H_5NH_2 \cdot C_6H_5SO_3H$

SOLUBILITY OF ARYLAMINE SALTS OF BENZENE MONO SULFONIC ACID,
EACH SEPARATELY, IN WATER.

(Keyworth, 1924.)

Compound	Formula	m. pt.	t°	(Gms. Compound per 100 gms. sat. sol.)
Benzene Mono Sulfonate of:				
Aniline	$C_6H_5NH_2 \cdot C_6H_5SO_3H$	240	19	11.3
o Toluidine	$C_6H_4(CH_3)NH_2 \cdot C_6H_5SO_3H$	176	19	20.0
m "	" "	173	18	9.1
p "	" "	205	16	7.4
α Naphthylamine	$C_{10}H_7NH_2 \cdot C_6H_5SO_3H$	234	14	0.77
β "	" "	248	14	0.50
p Nitro toluidine	$NO_2C_6H_4CH_3NH_2 \cdot C_6H_5SO_3H$	222	15	1.84
m Nitro aniline	$NO_2C_6H_4NH_2 \cdot C_6H_5SO_3H$	236	15	1.85
m Xylidene	$(CH_3)_2C_6H_3NH_2 \cdot C_6H_5SO_3H$	233	15	1.46
Benzidine	$(C_6H_4NH_2)_2 \cdot C_6H_5SO_3H$	330 ⁺	16	0.59
o Tolidide	$[NH_2(CH_2)_2C_6H_4]_2 \cdot 2C_6H_5SO_3H$	310	15	1.45
Di anisidine	$(CH_3OC_6H_4NH_2)_2 \cdot 2C_6H_5SO_3H$	277	18	2.11
m Phenylene diamine	$C_6H_4(NH_2)_2 \cdot 2C_6H_5SO_3H$	320 ⁺	17	19.0
p "	" "	320 ⁺	10	2.57
p Chloro aniline	$ClC_6H_4NH_2 \cdot C_6H_5SO_3H$	245	20	2.51
o "	" "	204	—	—
ψ Cumidine	$(CH_3)_2CHC_6H_4NH_2 \cdot C_6H_5SO_3H$	217	16	2.03
p Anisidine	$CH_3OC_6H_4NH_2 \cdot C_6H_5SO_3H$	182	16	12.8
p Phenetidine	$C_2H_5OC_6H_4NH_2 \cdot C_6H_5SO_3H$	171	17	21.0

Results similar to the above for Arylamine Salts of α Naphthol, 4, Sulfonic acid (Neville and Winther's acid) and for Arylamine Salts of Acetyl amino naphthalene, 4, sulfonic acid, using, however, as solvent aq. 1% acetic acid instead of water, are given by Forster and Watson, 1927.

Results for the solubility in water of Arylamine salts of α Naphthol, 2, sulfonic acid (Schäffer's α acid, m. pt. 125°), of Crocein, of Crocein R and of Crocein G, are given by Forster and Keyworth, 1927.

N-DIMETHYL β NAPHTHYLAMINE $C_{10}H_7N(CH_3)_2$

Freezing-point data for mixtures of N, Dimethyl β naphthylamine and 2,4,6 trinitro anisole are given by Hertel and van Cleef, 1928.

PHENOLATE of Phenyl Ammonium. $C_6H_5OH \cdot C_6H_5NH_2$

SOLUBILITY IN WATER.

(Alexew, 1886.)

The determinations were made by the synthetic method (see p. 292). The results were plotted and the following figures read from the curve:

t°	Gms. Phenolate per 100 Gms. Aq. Layer. Phenolate Layer		t°	Gms. Phenolate per 100 Gms. Aq. Layer. Phenolate Layer	
10	3	94	110	9	76
30	4	93	120	12	69
50	5	91	130	17.5	60
70	6	87.5	140 crit. temp.		40
90	7	83			

TETRA METHYL PHTHALAN $C_{12}H_{16}O$.

Freezing-point data for mixtures of tetra methyl phthalan with naphthols, brom phenol, iodo phenol, tri bromo phenol, tri chloro phenol, catechol, resorcinol, p xylenol and with phenyl,acetic acid are given by Bennett and Wain, 1936. These authors also give similar results for the cyclic oxides $C_{16}H_{22}O$ and $C_{18}H_{20}O$.

PHENYL CAPROIC ACID $CH_2(C_6H_5)(CH_2)_4COOH$.

100 gms. H_2O dissolve 0.048 gm. $C_{12}H_{16}O_2$ at 30° and 0.077 gms. at 40° .
(Daniels and Lyons, 1931.)

ARBUTIN $C_{12}H_{16}O_7 \cdot \frac{1}{2}H_2O$.

100 gms. trichlorethylene dissolve 0.011 gm. arbutin at 15° .

(Wester and Bruins, 1914.)

3.5 DimethoxyACETOPHENETIDE hydrate $C_{12}H_{17}O_4N \cdot H_2O$.

SOLUBILITY IN WATER. (Bogert and Ehrlich, 1919.)

The freezing-point method was used up to 57° and the sealed tube method above this temperature and for the solubility of the liquid hydrate in water.

t°.	Results for the solid hydrate.		t°.	Results for the liquid hydrate.

DIACETYL DIETHYL d TARTRATE $(CH_3COCH_2CO_2C_2H_5)_2$.

Freezing-point data are given for mixtures of diacetyl diethyl tartrate and:

Diacetyl diethyl r tartrate(2)	Nitro benzene(4)
Ethylene bromide(1)(4)	" toluene(4)
Naphthalene(3)(4)	Phenol(4)
	p Xylene(1)

(1) Bruni and Finzi, 1905; (2) Findlay and Campbell, 1928; (3) Palazzo and Batelli, 1883; (4) Scheuer, 1910.

DIPROPIONYL DIMETHYL d TARTRATE $(CH_3CO_2C_2H_5CO_2CH_3)_2$.

Freezing-point data for mixtures of the dipropionyl dimethyl d and r tartrates are given by Findlay and Campbell, 1928.

DEXTRIN $C_{12}H_{20}O_{10}$.

SOLUBILITY IN WATER. (Lewis, 1914.)

"In the case of dextrin, however, no matter how small an amount of water be employed, under no condition does the concentration of the solution remain constant, while on the other hand the addition of further solvent, never fails to dissolve additional dextrin, although the use of no amount of water, however large, will dissolve the whole of the sample."

100 gms. pyridine dissolve 65.44 gms. dextrin at $20-25^\circ$.

100 gms. 2% pyridine dissolve 102 gms. dextrin at $20-25^\circ$.

(Dehn, 1917.)

ETHYL SUBERATE $(CH_2)_6(COOC_2H_5)_2$.

100 cc H_2O dissolve 0.068 gm. $(CH_2)_6(COOC_2H_5)_2$ at 20° . (Sobotka and Kahn, 1931.)

n DECYL MALONIC ACID $CH(C_9H_{19})(COOH)_2$.

100 gms. H_2O dissolve 0.0025 gm. $CH(C_9H_{19})(COOH)_2$ at 25° .
 " " C_8H_6 " 0.0066 " " "

(Verkade and Coops, Jr., 1930a.)

Iso BUTYL TARTRATES d, l and r $[CHOH.CO_2C_4H_9]_2$.

SOLUBILITY OF d AND OF r ISO BUTYL TARTRATES AND OF
 THEIR MIXTURES IN ETHYL ALCOHOL.

(Campbell, 1929.)

t°	Gms. per 100 gms. C_2H_5OH		
	d Tartrate	r Tartrate	d + r Tartrates
0	35.0	34.9(1)	33.75 d + 18.35 l
18	50.7	56.9(1)	101.85 d + 51.15 l
25	58.4	71.5(1)	117.75 d + 58.25 l

(1) Total d + l.

These results show that "the total solubility is always increased by additions of the active form to the inactive, i.e. the liquid phase becomes active. At all the above temperatures, therefore, the solid inactive form is a solid racemate."

The author also gives results for the freezing points of mixtures of iso butyl d and l tartrates.

SUGAR (Sucrose) $C_{12}H_{22}O_{11}$ (Cane Sugar).

FREEZING-POINTS OF AQUEOUS SOLUTIONS OF CANE SUGAR.

(Kremann and Eitel, 1923.)

t° of f. pt.	Gms. $C_{12}H_{22}O_{11}$ per 100 gms. sat. sol.	t° of f. pt.	Gms. $C_{12}H_{22}O_{11}$ per 100 gms. sat. sol.	t° of f. pt.	Gms. $C_{12}H_{22}O_{11}$ per 100 gms. sat. sol.

100 gms. absolute methyl alcohol dissolve 1.18 gms. cane sugar at 19°. (de Bruyn, 1892.)

100 gms. aq. 50 per cent pyridine dissolve the following gms. of sugars at 20°-25°: sucrose, 38.5; maltose, 43.07; mannose, 78.70; lactose, 1.98; fructose, 85.42; galactose, 68.3; glucose, 49.17; raffinose, 8.76. (Dehn, 1917.)

100 gms. trichlorethylene dissolve 0.004 gm. cane sugar at 15°. (Wester & Bruins, 1914.) For additional data on Galactose, see p. 448 and on Glucose, see p. 445

SOLUBILITY OF CANE SUGAR IN AQUEOUS ACETONE AT 25° (Hertz, *Ann.* 1894, 10, 1)

Sp. Gr. of Solutions.	% Acetone per 100 cc. Solvent	Gms. Sugar per 100 cc. Solution	H ₂ O	C_2H_5O	$C_2H_5O_2$
1.3306	0	89.8	43.4	0	89.8
1.2796	20	76.7	42.9	8.4	76.7
1.2401	30	72.1	40.8	13.4	72.1
1.2002	40	59.3	39.8	20.0	59.3
1.1613	45	57.5	40	24.6	57.5

Above 45 cc. acetone per 100 cc. solvent the solution begins to separate into two layers. The lower of the two contains 81 gms. sugar per 100 cc. and has Sp. Gr. 1.1522. The upper layer contains so little sugar that the amount could not be determined by the method employed. Two cc. evaporated in a vacuum desiccator left a residue of 1.68 gms. Above the concentration of 80 cc. acetone per 100 cc. solvent the two layers unite. In pure acetone 100 cc. solution gave a residue of 0.18 gm. sugar.

SOLUBILITY OF SEVERAL SUGARS IN PYRIDINE AT 20° (H-2) 1900

Sugar	Formula	Gms. per 100 cc. Solvent	Gms. Sugar per 100 cc. Solvent
Cane Sugar (Sucrose)	$C_{12}H_{22}O_{11}$	0.981	0.45
Milk Sugar (Lactose)	$C_{12}H_{22}O_{11}H_2O$	1.081	1.15
Grape Sugar (Glucose)	$C_6H_{12}O_6$	1.057	1.61
Fruit Sugar (Fructose)	$C_6H_{12}O_6$	1.085	1.85
Galactose	$C_6H_{12}O_6$		1.85*
Maltose	$C_{12}H_{22}O_{11}$		1.95*
Mannose	$C_6H_{12}O_6$		2.0*
Raffinose	$C_{18}H_{34}O_{16}H_2O$		2.0*

* It is uncertain whether these figures refer to gms. per 100 gms. solvent or gms. per 100 cc. pyridine at 20° 25°.

SOLUBILITY OF MILK SUGAR (LACTOSE) HYDRATE AND β ANHYDRIDE IN WATER.

(Hudson, 1904, 1908.)

It was found that the saturation point was reached very slowly with this compound. From the results, it was concluded that "aqueous solutions of milk-sugar contain two substances in equilibrium and that the mutarotation of milk-sugar results from the slow establishment, in cold solutions, of the equilibrium of the balanced reaction, $C_{12}H_{24}O_{12}$ (Hydrate) \rightleftharpoons $H_2O + C_{12}H_{22}O_{11}$ (β -anhydride).

The final solubility of hydrated milk sugar was determined by approaching saturation from below and from above with mixtures of water and excess of once recrystallized hydrated milk sugar. These were constantly rotated until equilibrium was reached (one week was allowed in all cases). The filtered saturated solutions were evaporated to dryness and the crystalline residues, consisting of the α and β anhydrides, weighed.

t°.	Gms. $C_{12}H_{22}O_{11}$ per 100 Gms. Sat. Sol.	t°.	Gms. $C_{12}H_{22}O_{11}$ per 100 Gms. Sat. Sol.
0	10.6	49	29.8
15	14.5	64	39.7
25	17.8	74	46.3
30	24	89	58.2

The initial solubility, obtained by agitating an excess of milk sugar hydrate with water for a few minutes, was somewhat less than one-half the above figures, at temperatures up to 25°.

The final solubility of β anhydrous milk sugar was difficult of determination on account of the high concentration and instability of the saturated solution below 92°. At 0° the final saturation was hastened by addition of 0.1 N NH_4OH solution. At 0°, 42.9 gms. $C_{12}H_{22}O_{11}$ per 100 gms. sat. solution were found and at 100°, 61.2 gms.

SOLUBILITY OF α AND β LACTOSE (MILK SUGAR) IN WATER. (Gillis, 1920.)

The determinations were made to supplement those of Hudson, 1908. Accurately weighed amounts of the sugar and water were sealed in tubes, and, while being slowly agitated, the temperature was determined at which the last crystal just disappeared.

The column headings for mol. % and wt. % as given in the original table for α lactose are the reverse of those here shown.

The author gives an exhaustive treatment of the equilibria between the two anhydrous modifications of lactose and considers the system water-milk sugar to be a pseudo ternary system with a transi-dehydration temperature of 93.5°.

Results Obtained with α Lactose.

t	Mol. % $C_{12}H_{22}O_{11}$ in sat. sol.	Gms. $C_{12}H_{22}O_{11}$ per 100 gms. sat. sol.

SOLUBILITY OF HYDRATED LACTOSE IN WATER. (Sallard, 1919)

The hydrated lactose which was used contained a trace of mineral matter and less than 0.10% hygroscopic H_2O as determined by drying at 100° . Constant agitation was employed for obtaining saturation and equilibrium was approached from below and from above. In the latter case the mixture was previously heated to 75° - 80° . A trace of formal was added in both cases, before the period of agitation.

Gms. $C_{12}H_{22}O_{11}$ per 100 gms. H_2O at	0°	10°	20°	30°	40°	50°	60°
	0.0	1.0	3.0	5.0	7.1	10.0	17.0

NOTE. It is pointed out by Gills, 1920, that the above determinations at 30° , 50° and 60° , and the result of Hudson at 80° , are undoubtedly incorrect. Very carefully made new determinations between 30° and 100° , have confirmed the trans-dehydration temperature of 41° for α and β lactose.

SOLUBILITY OF LACTOSE IN MIXTURES OF WATER AND PYRIDINE. (Fischer and Dehn, 1921)

Percent $C_{12}H_{22}O_{11}$ in solvent	Temp. 10° to 20° per 100 gms. solvent		Percent $C_{12}H_{22}O_{11}$ in solvent	Temp. 40° to 50° solvent

Sym. DIPHENYL CARBAZIDE (carbohydrazide) 1,5-(C₆H₅NHNH)₂CO.

Freezing point data are given for mixtures of s diphenyl carbazide and 1-phenyl semicarbazide by Sswetlow, 1933.

Freezing-point data are given for mixtures of sym. diphenyl carbazide and 1-phenyl semi carbazide by Noller, 1930.

ACETYL AMINO ANTIPYRINE (C₁₃H₁₅N₃O₂) (CH₃)₂NH(C₆H₄)N(CH₃)₂

Freezing point data are given for mixtures of acetyl methyl antipyrine and:

- n Methyl phenyl volental (Pfeiffer and Seydel, 1928.)
- n Phenyl volental
- Veronal (C-Diethyl barbituric acid) (Pfeiffer and Angern, 1926.)
- Volental (carbamimic acid tri chlor ethyl ester) (Pfeiffer and Angern, 1926)

PYRAMIDON (Dimethyl amino antipyrine): phenyl, 2,4 dimethyl, 4 dimethyl amine, 5 pyrazolone) (C₁₁H₁₁ON₂)N(CH₃)₂

SOLUBILITY OF PYRAMIDON IN WATER.

(characteristic, 100°):

The curve representing the solubility of pyramidon in water is quite unusual in that at temperatures above 68° the system separates into two liquid phases of which the curve of demarcation is a complete circle.

t°	Gms. (C ₁₁ H ₁₁ ON ₂)N(CH ₃) ₂ per 100 gms. sat. sol.	Solid Phase	Results for the liquid layer

			92	13.8		77.7
			115	11.5		79.5

Due to the peculiar solubility of pyramidon in water it will be noted, for instance, that when a mixture of one part of pyramidon and 9 parts of water which forms a saturated solution at about 50°, is heated in a sealed tube, it becomes cloudy at about 100° and becomes clear again at about 110°. On cooling, the reverse phenomena occur and crystals separate only when the temperature decreases to about 60°. This solution is therefore saturated at three different temperatures. A solution of somewhat lower concentration is, however, saturated at only one temperature.

PYRAMIDON

Freezing-point data are given for mixtures of pyramidon and:

Acetanilide(1)	Methyl amino benzoate(7)	Pheno barbital(Luminal(6)
o Amino phenol(7)	" barbituric acid(6)	Phenyl urethan(5)
Barbital(2)(4)	" p oxy benzoate(7)	" veronal(6)

(1) Angeletti, 1927; (2) Pfeiffer, 1925; (3) Pfeiffer and Angern, 1926; (4) Pfeiffer and Ochiai, 1932; (5) Pfeiffer and Seydel, 1928; (6) Pfeiffer and Seydel, 1928a; (7) Pfeiffer and Seydel, 1928b; (8) Rheinboldt and Kirscheisen, 1925; (9) Sandquist and Hök, 1927.

SALICIN $C_6H_4(CH_2.OH)O.C_6H_{11}O_6$.**SOLUBILITY IN SEVERAL SOLVENTS.**

Solvent.	t°.	Gms. per 100 Gms. Solvent.	Authority.
Water	15	3.52	(Greenish and Smith, 1903.)
Water	25	4.16	(Dott, 1907.)
90% Alcohol	15	1.5	(Greenish and Smith, 1903.)
90% Alcohol	15	2	(Squire and Caines, 1905.)
Trichlor Ethylene	15	0.013	(Wester and Bruins, 1914.)

NOVOCAINE (base) $CH_2(C_6H_4NH_2COO)CH_2[N.(C_2H_5)_2].2H_2O$.

100 cc. H_2O dissolve 0.333 gm. anhydrous novocaine at 20°. (Zalai, 1910.)
 100 cc. oil of sesame dissolve 4.29 gms. anhydrous novocaine at 20°.

Determinations of the dissociation constants, solubilities in water and distribution coefficients between water and ether of Novocaine, $NH_2C_6H_4COO.CH_2.CH_2N(C_2H_5)_2$, and of Pantocaine, $NH(C_6H_9)C_6H_4COO.CH_2.CH_2N(CH_3)_2$, are described by Eisenbrand and Pitcher, 1938. The solubility of these compounds in water depends upon the hydrogen ion concentration of the solution. The dissociation constants show that Novocaine is completely undissociated at pH10 and Pantocaine at pH9. The solubilities at these hydrogen ion concentrations were found to be:

0.013 gm. Novocaine per 100 cc H_2O at ? t°.
 0.0156 " Pantocaine " " " " " " "

NOVOCAINE (Hydrochloride) $CH_2(C_6H_4NH_2COO).CH_2[N(C_2H_5)_2].HCl$.

100 gms. H_2O dissolve about 100 gms. of the salt at room temp.
 100 gms. alcohol dissolve about 3 gms. of the salt at room temp.

NOVOCAINE Bichromate $(C_{13}H_{20}O_2N_2)_2 \cdot H_2Cr_2O_7$.

SOLUBILITY OF NOVOCAINE BICHROMATE IN WATER.
(Rungturg, de Jong and Holleman, 1927.)

In this system separation into two liquid layers occurs at 74° , between the concentrations 9 and 74 percent salt. The determinations were made by the sealed tube method (thermic analysis) and the results are given in the form of a diagram from which the following approximate values were read

t°	Gms. $(C_{13}H_{20}O_2N_2)_2 \cdot H_2Cr_2O_7$ per 100 gms. sat. sol.	Solid Phase	Results for the liquid layers	
			t°	Gms. $(C_{13}H_{20}O_2N_2)_2 \cdot H_2Cr_2O_7$ per 100 gms. sat. sol.
63	2.0	$(C_{13}H_{20}O_2N_2)_2 \cdot H_2Cr_2O_7$	80	11

SOLUBILITY OF ANTHRAQUINONE IN ETHER.

(From J. H. Henschel, *ibid.*, 1917.)

Weighed amounts of ether and anthraquinone were placed in glass tubes which were then sealed. The temperature noted at which the anthraquinone disappeared and also at which the liquid phase disappeared (critical temp.). The two curves cross at 194° and again at 241°. Between these two temperatures the critical curve lies below the solubility curve, hence for this range of temperature no solubility curve is shown. The following figures were read from the curves, and are therefore only approximately correct.

t°	Gm. C ₁₀ H ₁₆ O per 100 g. solution	t°	Gm. C ₁₀ H ₁₆ O per 100 g. solution	t°	Gm. C ₁₀ H ₁₆ O per 100 g. solution
140	3	241	50	260	80
150	4	245	40	270	95
170	4.5	247	50	275	100
195	5.0	250	60		

Two parts of toluene dissolve 0.19 part anthraquinone at 18° and 5.56 parts at 100° (A. Bechler).

Two gms ether dissolve 0.104 gm. anthraquinone at 26°.

(Hatchcock, *ibid.* and *ibid.*, 1917.)

Data for the solubility of anthraquinone in mixtures of phenol and water are given by Limmertmanns (1907).

Two gms carbon tetrachloride dissolve 0.013 gm. C₁₄H₈(CO)₂.H₂ at 20° (Paulowski, *ibid.*, 1914, 1920).

(1) Estimated from author's diagram.

TANNIC ACID

When a sample of tannic acid of apparently very good quality was added to water at room temperature, the solution increased so greatly in viscosity, that even before the saturation point was reached, it became evident that a satisfactory separation of liquid and solid could not be made. The solubility in water is variously given in the pharmaceutical literature from about 20 to 400 gms. tannic acid per 100 gms. of water. Similarly, the quoted results for the solubility in alcohol vary from about 50 to 400 gms. acid per 100 gms. of alcohol. (Beckell, 1903)

100 gms. glycerol dissolve 48.8 gms. tannin at 15°. (Ozolski, 1907)

100 gms. trichlorethylene dissolve 0.012 gm. tannin at 15°. (Wester and Burns, 1914)

3-METHYL ACRIDINE C₁₃H₉N.CH₃.

Freezing point data are given for:

3-Methyl acridine + Acridine (Pascal, 1914.)

" " + Anthracene (Pascal, 1921.)

DESYL CHLORIDE C₈H₈CHClCOOC₆H₅.

Freezing-point data for mixtures of desyl chloride and methyl deoxy benzoin are given by Preiserwerk and Krienmeyer, 1914.

BENZIL α and β MONO-OXIME C₆H₅CH(OH)C(=O)C₆H₅.

Results for equilibrium in the systems benzil α and β mono oximes and benzene are given by Taylor and Marks, 1940.

STILBENE $C_6H_5CH:CH.C_6H_5$.

Freezing-point data for mixtures of stilbene and *p* dimethoxystilbene are given by Pascal and Normand (1913).

Freezing-point data are given for mixtures of:

Stilbene + Azobenzene (Pascal and Normand, 1913; Beck, 1904.)	
" + Benzil (Vanstone, 1913.)	
" + Benzal aniline (Pascal and Normand, 1913.)	
" + Bibenzyl " " " " ; Bruni, 1898; Garelli, and Colzolari, 1899.)	
" + Picric acid (Jefremow, 1918.)	
" + Styphnic acid (Jefremow, 1918, 1919a.)	
" + Azo toluene (Pascal and Normand, 1913.)	

DIHYDRO ANTHRACENE $9,10-C_6H_4:(CH_2)_2:C_6H_4$.

Freezing-point data for mixtures of dihydro anthracene and anthracene are given by Grimm, Gunther and Titus, 1931.

BENZALAZINE (Benzaldehyde azine) $C_6H_5CH:NN:CHC_6H_5$.

Freezing-point data are given by Pascal, 1914, 1921, for mixtures of benzalazine and each of the following compounds: Cinnamylidene aniline, dibenzyl hydrazine, dimethyl hydrazine, diphenyl butadien, diphenyl diacetylene, diphenyl hydrazine, furfuralazine, naphthalene and α naphtholazine. Results are also given for mixtures of Thio phenyl alazine and cinnamylidene.

ACETYL BIPHENYL (Biphenyl methyl ketone) $C_6H_5C_6H_4COCH_3$.

Freezing-point data are given for mixtures of acetyl biphenyl with β naphthylamine and with *p* toluylic acid by Pfeiffer, Angern, Wang, Seydel and Quehl, 1930.

Phenyl GlyoxalPHENYL HYDRAZONE, α and β forms, $C_6H_5.CO.CH:N.NHC_6H_5$.

SOLUBILITY OF PHENYL GLYOXAL HYDRAZONE IN SEVERAL SOLVENTS.
(Sidgwick and Ewbank, 1921.)

The determinations were made by the synthetic method. In the case of alcohol as the solvent, the α form of the compound is transformed into the β form before saturation is reached. Hence results could be obtained only for the β form in alcohol. M. pt. of α form = $114-117^\circ$; of β form = about $145-146^\circ$.

RESULTS OF THE SOLUBILITY DETERMINATIONS IN :

ACRIFLAVINE (10-chloro methyl, 3,6 diamino acridine hydrochloride)
 $\text{C}_{13}\text{H}_{11}\text{N}_2\text{CH}_2\text{Cl} \cdot \text{HCl}$.

SOLUBILITY OF MIXTURES OF ACRIFLAVINE AND THE NEUTRAL
 HYDROCHLORIDE OF DIAMINO ACRIDINE IN WATER AT 20°.

(Galliat, 1934.)

Gms. per 100 gms. of dry mixture		Gms. of mixture dissolved per 100 cc. saturated solution
Chloro methylate of diamino acridine	Neutral hydrochloride of diamino acridine	
100	0	0.4
80	20	1.2
60	40	2.1
50	50	2.4
40	60	2.1
20	80	1.6
0	100	0.8

The above experiments and similar ones made with other mixtures show that acriflavine does not possess the solubility and other properties mentioned by the British Pharmacopoeia. Analyses of samples purchased as the chloro methylate contained only 55 to 70 percent of this product. The experiments made with various mixtures of acriflavine and diamino acridine show that those containing from 45 to 55 percent of the hydrochloride of the chloro methylate of diamino acridine correspond in solubility with the figure given in the British Pharmacopoeia. The pure compound is considerable less soluble than commercial samples.

BIBENZYL $C_6H_5CH_2CH_2C_6H_5$.

100 gms. sat. solution of Bibenzyl in liquid sulfur dioxide contain 28 gms. $C_{14}H_{14}$ at 2° . (DeCarli, 1927.)

Freezing-point data are given for mixtures of Bibenzyl and:

Azobenzene(7)(2)(9)(10)	Biphenyl(5)	Phenyl benzyl ether(7)
Benzal aniline(7)	Diphenyl disulfide(3)	Picric acid(4)
Benzoin(8)	Hydrazo benzene(7)	Stilbene(1)(2)(7)
Benzo phenone(6)	Nitro toluene(6)	Styphnic acid(4)
Benzyl phenol(7)		Tolan(7)

Results for mixtures of Bibenzyl β Naphthylamine and Sarcosine anhydride are given by (4)

(1) Bruni, 1898; (2) Garelli and Calzolari, 1899; (3) Grimm, Gunther and Titus, 1931; (4) Jefremow, 1918, 1919, 1919a; (5) Lee and Warner, 1935; (6) Malotau and Straub, 1937; (7) Pascal and Normand, 1913; (8) Vanstone, 1913; (9) Bruni and Gorni, 1899; (10) Hasselblatt, 1913.

BENZYL SULFIDE $(C_6H_5CH_2)_2S$.

100 gms. $CHCl_3$ dissolve 133.91 gms. $(C_6H_5CH_2)_2S$ at 20° .
 " " CCl_4 " 73.16 " " " " (Pawlewski, 1914.)

BITOLYL $CH_3C_6H_4C_6H_4CH_3$.

Freezing-point data are given by Grimm, Gunther and Titus, 1931, for mixtures of Bitolyl with benzidine, with dichloro biphenyl and with biphenol.

AZOTOLUENE $CH_3C_6H_4N:NC_6H_4CH_3$.

Freezing-point data are given by Pascal and Normand, 1913, for mixtures of azotoluene with azobenzene and with stilbene.

CYSTINE $C_{14}H_{14}N_2O$.

100 cc. sat. sol. of cystine in water contain 0.0168 gm. $C_{14}H_{14}N_2O$ at 21° .
 " " in 0.02 mol. $(NH_4)_2SO_4$ " 0.0054 " "

The method followed by Pfeiffer and Angern, 1924, in making the above determinations is described under Alanine, p. 199

CYSTINE

SOLUBILITY OF CYSTINE IN VARIOUS AQUEOUS SOLUTIONS OF DIFFERENT HYDROGEN ION CONCENTRATION AT 25°. Sano, 1926.

The desired p_H value of the solution was always secured with only such acids and bases as form easily soluble salts with the amino acid. In all cases the solid phase was the amino acid. A large excess of cystine was shaken at 5° with the solvent and the sat. solution, after filtration, was used for the determination of p_H by means of the hydrogen electrode and of the dissolved amino acid by a nitrogen determination.

Solvent	p_H of sat. sol.	Gms. N per liter sat. sol.	Solvent	p_H of sat. sol.	Gms. N per liter sat. sol.

+0.1 <i>n</i> CH ₃ COONa...	4.59	0.01310			

The solubility minimum is at p_H 3.76 and the sat. solution contains 0.01278 gm. N, corresponding to 0.1097 gm. cystine.

HYDROBENZOIN C₈H₈CHOH.CHOHC₈H₈.

Freezing-point data for mixtures of the isomeric hydrobenzoin are given by Bösen and Eisen, 1928, and by Read and Steele, 1927.

AZOANISOLE C₆H₄OCH₃N.NC₆H₄OCH₃.

Freezing-point data for mixtures of *p* Azoanisol with azoxyanisol, with azoanisol phenetol, with azo phenetol and with methyl propyl azophenol are given by Bogojawlauský and Winogrodow, 1907.

p AZOXYANISOLE (C₆H₃OHOC₃)₂N₂

Freezing-point data are given for mixtures of *p* azoxyanisol and:

<i>p</i> Azoanisol(1)	Benzo phenonet(3)	Nitro benzene(2)
<i>p</i> Azoanisol phenol(1)	Ethylene bromide(2)	<i>p</i> oxybenzal <i>p</i> anisidine
<i>p</i> Azoxy phenetol(4)(5)	Hydroquinone(3)	acetate(6)
Benzenet(2)	<i>p</i> Methoxy cinnamic acid(3)	

(1) Bogojawlawski and Winogrodow, 1907; (2) Bogojawlawski, Winogrodow and Bogolubow, 1906; (3) de Kock, 1904; (4) Prins, 1909; (5) Ratinganz and Rotalski, 1906; (6) Robberecht, 1938.

METHYL ORANGE $(CH_3)_2NC_6H_4N:NC_6H_4SO_3Na$.

SOLUBILITY OF METHYL ORANGE IN WATER AT 18°.
(von Euler and Rudberg, 1924.)

pH of the solution	Gm. Mol. Methyl Orange per liter	pH of the solution	Gm. Mol. Methyl Orange per liter
5.0	0.00022	3.6	0.00004
4.2	0.00010	2.5	0.00003
4.0	0.00005	1.1	0.000042

The authors also found that one liter of an aqueous 0.02 normal solution of glyccoll dissolves 0.00032 gm. mol. (= 0.0966 gm.) methyl orange at 17.5°.

DI p TOLYL AMINE $(CH_3C_6H_4)_2NH$.

Freezing-point data for mixtures of di p tolyl amine and phenyl p tolyl amine are given by Chapman and Perrott, 1930.

6-AMINO, 3,4'-DIMETHYL AZOBENZENE $CH_3C_6H_4N:NC_6H_3(CH_3)NH_2$.

Freezing-point data for mixtures of 6, Amino, 3,4-dimethyl azobenzene and sarcosine anhydride are given by Pfeiffer, Angern, Wang, Seydel and Quehl, 1930.

p DIMETHYL AMINO AZOBENZENE $(CH_3)_2NC_6H_4N:NC_6H_5$.

Experiments showing the distribution of p dimethyl amino azobenzene between aqueous solutions of sodium salts of fatty acids (soaps)+ether, and of the effect of varying concentrations of methyl alcohol upon this distribution, are given by Smith, 1932a.

100 cc sat. solution of p dimethyl amino azobenzene in ethyl ether contain 2.99 gms. $C_{14}H_{16}N_2$ at 15.5°.

The following results are also given of the solubility of p dimethyl amino azobenzene in aqueous solutions of methyl alcohol.

Percent CH_3OH in aq. solvent	Gms. $C_{14}H_{16}N_2$ per liter	Percent CH_3OH in aq. solvent	Gms. $C_{14}H_{16}N_2$ per liter
0	0.00032	20	0.00195
5	0.00041	30	0.00335
15	0.0010	40	0.0102

Freezing-point data for mixtures of p dimethyl amino azobenzene with m dinitro benzene, with p nitro toluene, with 2,4-dinitro toluene and with 2,4,6-tri nitro toluene are given by Giua and Reggiani, 1925.

N-METHYL p TOLUENE SULFON ANILIDE $CH_3C_6H_4SO_2N(CH_3)C_6H_5$.

SOLUBILITY OF N-METHYL p TOLUENE SULFON ANILIDE IN AQUEOUS SOLUTIONS OF ACETIC ACID.

(Bradfield and Williams, 1929.)

(See Benzanilide p. 725)

Gms. CH_3COOH per 100 gms. aq. solvent	Gms. $CH_3C_6H_4SO_2N(CH_3)C_6H_5$ 20°	Gms. $CH_3C_6H_4SO_2N(CH_3)C_6H_5$ 25°	Gms. $CH_3C_6H_4SO_2N(CH_3)C_6H_5$ 30°	Gms. $CH_3C_6H_4SO_2N(CH_3)C_6H_5$ 35°	Gms. $CH_3C_6H_4SO_2N(CH_3)C_6H_5$ 40°

Almost insoluble

DIBENZYL HYDRAZINE $C_6H_5CH_2.NH.NHCH_2C_6H_5$.

Freezing-point data for mixtures of dibenzyl hydrazine with benzalazine and with cinnamylidene aniline are given by Pascal, 1914.

DIMETHOXY BENZIDINE $3,3'[(CH_3ONH)C_6H_3]_2$.

Freezing-point data for mixtures of dimethoxy and diethoxy benzidines are given by Ingold and Kidd, 1933.

AMYL CUMARIC (and Cumarinic) ACID $C_{14}H_{18}O_3$.

One liter sat. sol. of Amyl cumaric acid in H_2O contains 0.0197 gms. $C_{14}H_{18}O_3$ at 25°.

One liter sat. sol. of Amyl cumarinic acid in H_2O contains 0.114 gms. $C_{14}H_{18}O_3$ at 25°. (Roth and Stoermer, 1913.)

ACETYLENE ETHYL TETRA CARBONATE $[CH(CO_2C_2H_5)_2]_2$.

Freezing-point data for mixtures of acetylene ethyl tetra carbonate with ethylene cyanide are given by Timmermans and Mme. Vesseloovsky, 1931.

UNDECYL MALONIC ACID $CH(C_{11}H_{22})(COOH)_2$.

100 gms. C_6H_6 dissolve 0.0139 gm. $CH(C_{11}H_{22})(COOH)_2$ at 25°.

(Verkade and Coops, Jr., 1930a)

ETHYL SEBACATE $(CH_2)_8(COOC_2H_5)_2$.

100cc H_2O dissolve 0.008 gm. $(CH_2)_8(COOC_2H_5)_2$ at 20°.

(Sobotka and Kahn, 1931)

MYRISTIC ACID $CH_3(CH_2)_{12}COOH$.

The melting-point depressions of mixtures of myristic and other fatty acids as a method of estimating the percentages of individual fatty acids in mixtures are reported by Wenzel, 1934.

Results for the freezing-points of mixtures of myristic and palmitic acids are given by Kulka and Sandin, 1937.

TRIMYRISTIN $C_3H_5[CH(CH_2)_{12}COO]_3$.**SOLUBILITY OF TRIMYRISTIN IN SEVERAL SOLVENTS.**

(Loskit, 1928.)

The determinations were made by the thermic, the sealed tube and the analytical method. The author's results were plotted and the following table constructed from the curves.

t°	Gms. $C_{25}H_{50}[CH(CH_2)_{12}COO]_3$ per 100 gms. sat. solution in:			
	C_6H_6	$(C_2H_5)_2O$	$CHCl_3$	CS_2
0	—	—	10.0	0.5

1-AMINO, 2-METHYL ANTHRAQUINONE $CH_3C_6H_3(CO)_2C_6H_3NH_2$.

Freezing-point data for mixtures of 1-amino, 2-methyl anthraquinone and 1-chloro, 2-methyl anthraquinone are given by Grimm, Gunther and Titus, 193

CHALCONE (Benzal aceto phenone) $C_6H_5CH:CHCOOC_6H_5$.

Freezing-point data are given for mixtures of Chalcone and:

Naphthols (Giua, 1916.)

Nitro phenols (Asahina, 1934.)

OXY CHALCONE (2' and 4' Oxy benzal aceto phenone) $C_6H_4(OH)(CH:CHCOOC_6H_5)$.

Freezing-point data for mixtures of 2' and 4' Oxy benzal acetophenone with 2,4,6-tri nitro phenol are given by Asahina, 1934.)

CINNAMYLIDENE ANILINE $C_6H_5CH:CH.CH:NC_6H_5$.

Freezing-point data for mixtures of cinnamylidene aniline with benzalazine with dibenzyl hydrazine, with diphenyl butadien and with diphenyl diacetylene are given by Pascal, 1914.

DIBENZYL ACETONE $(C_6H_5CH_2)_2CO$.

Freezing-point data for mixtures of dibenzyl acetone and chloro acetic acid are given by Kendall and Gibbons, 1915.

METHYL DESOXY BENZOIN $C_6H_5CH(CH_3)COC_6H_5$.

Freezing-point data for mixtures of methyl desoxy benzoïn and benzoïn are given by Preiswerk and Erlenmeyer, 1934.

BENZYL CARBONATE $(CH_2C_6H_5)_2CO_3$.

Freezing-point data for mixtures of benzyl carbonate and nitrite are given by Erlenmeyer and Leo, 1933.

GUAIACOL CARBONATE $[C_6H_4(OCH_3)_2]_2CO$.

SOLUBILITY IN WATER, ALCOHOL, ETC. (U. S. P. VIII.)

Solvent.	t°.	Gms. per 100 Gms. Solvent.	
		Guaiacol.	Guaiacol Carbonate.
Water	25	1.89	...
Alcohol	25	...	2.08
Chloroform	25	...	66.6
Ether	25	...	7.69
Glycerol	25	100	...

The coefficient of distribution of guaiacol carbonate between olive oil and water at 25° is given as $\frac{S_{oil}}{S_w} = 3.7$ by Boeseken and Waterman, 1911, 1912.

ANISAL AMINO ACETOPHENONE $C_{15}H_{15}O_2N$.

Freezing-point data are given by Robberecht, 1938, for mixtures of anisal amino acetophenone with p azoxy phenol ethyl carbonate and with cholesterol propionate.

DIMETHYL DIPHENYL UREA $N(CH_3)_2N(C_6H_5)_2.CO$.

Freezing-point data for mixtures of dimethyl diphenyl urea with nitro mannitol, with nitro penta erythritol and with tri methylene tri nitramine are given by Urbanski, 1933, and Urbanski and Rabek-Gawronska, 1934.

DI TOLYL THIO UREA $q (CH_3C_6H_5NH)_2CS$.

100 gms. CCl_4 dissolve 0.10 gm. $C_{15}H_{18}SN_2$ at 20°.
 " " $CHCl_3$ " 9.54 " " " (Pawlewski, 1914, 1926.)

SANTONIN C₁₅H₁₈O₃.

SOLUBILITY IN SEVERAL SOLVENTS.

Solvent	t°	Gms. C ₁₅ H ₁₈ O ₃ per 100 Gms. Solvent	Authority

SPARTEINE $C_{15}H_{26}N_2$.

SOLUBILITY OF SPARTEINE IN WATER AND IN AQUEOUS 5 PER CENT
SOLUTIONS OF SODIUM CARBONATE. (Valeur, 1917, 1919.)

The temperatures were determined at which clouding occurs in solutions of sparteine in water and in aqueous 5% Na_2CO_3 solutions. Recently distilled sparteine of rotation $-2^\circ 16'$ in a 5 dm tube was used.

Results for water		Results for Aq. 5 % Na_2CO_3 solutions

*This determination made by direct saturation and analysis of the solution by precipitation of the sparteine as picrate or phosphotungstate.

SPARTEINE SULFATE $C_{15}H_{26}N_2 \cdot H_2SO_4 \cdot 5H_2O$.

100 gms. H_2O dissolve about 200 gms. sparteine sulfate at $15-20^\circ$.

100 cc. 90% alcohol dissolve about 20 gms. sparteine sulfate at $15-20^\circ$.

(Squire and Caines, 1905.)

NAPHTHALENE PICRATE $C_{10}H_7(NO_2)_3O \cdot C_{10}H_7$.

SOLUBILITY OF NAPHTHALENE PICRATE IN BENZENE AND IN TETRALINE.
(Plattl, 1931.)

The results are given in the form of a diagram from which the following values were taken.

t°	Gms. $C_{10}H_7(NO_2)_3O \cdot C_{10}H_7$ per 100 gms. sat. solution in:	
	C_6H_6	Tetralin ($C_{10}H_{12}$)
5	8.1	—
10	9.2	3.6
20	12.7	5.8
30	17.0	8.6
40	24.6	12.3
45	29.5	—
50	—	17.3
60	—	24.0

Freezing-point data for mixtures of naphthalene picrate and methyl naphthalene picrate are given by Meyer and Meyer, 1919.

PYRENE $C_{16}H_{10}$

SOLUBILITY IN TOLUENE AND IN ABSOLUTE ALCOHOL.

100 gms. toluene dissolve 16.54 gms. pyrene at 18° .

100 gms. absolute alcohol dissolve 1.37 gms. pyrene at 10° and 3.08 gms. at b. pt.

DIPHENYL BIACETYLENE (Diphenyl butadiyne) $\text{C}_6\text{H}_5(\text{C}\equiv\text{C})(\text{C}_6\text{H}_5)$.

Freezing-point data for mixtures of diphenyl biacetylene with benzaldehyde and with diphenyl butadien are given by Pascal, 1914.

Freezing-point data for mixtures of diphenyl diacetylene and cinnamylidene aniline are given by Pascal, 1914.

FLUORANTHENE C₁₆H₁₀.

Freezing-point data are given by Shinomiya, 1940, for mixtures of fluoranthene and each of the following compounds: dinitro phenol, dinitro toluene, picramide, picryl chloride, trinitro anisole, trinitro benzene, trinitro cresol and trinitro toluene.

INDIGO $(\text{C}_6\text{H}_4 \begin{smallmatrix} \text{CO} \\ \text{NH} \end{smallmatrix} \text{C})_2$.

100 gms. 95% formic acid dissolve 0.14 gm. indigo at 19.8°. (Aschan, 1913)

CONGO RED $[\text{C}_6\text{H}_4\text{N}:\text{N.C}_6\text{H}_4(\text{NH}_2)\text{SO}_3\text{Na}]_2$.

100 gms. H₂O dissolve 11.6 gms. congo red at 20°-25°. (Behn, 1917.)

100 gms. pyridine dissolve 0.29 gm. congo red at 20°-25°. "

100 gms. aq. 50% pyridine dissolve 7.32 gms. congo red at 20-25°. "

DIBENZOYL ETHYLENE cis and trans C₆H₅COCH:CHCOOC₆H₅.

Freezing-point data for mixtures of cis and of trans dibenzoyl ethylene with azodibenzoyl are given by Grima, Gunther and Titus, 1941.

ATOPHAN (Cinchophen) Phenyleinchoninic Acid $2\text{C}_6\text{H}_4(\text{C}_6\text{H}_4\text{N})_2(\text{COOH})$.

SOLUBILITY IN SEVERAL SOLVENTS AT 25°. (Leach, Rabak and Clark, 1919.)

Solvent	Gms. Atophan per 100 gms. sat. sol.
Water.....	0.0160
95 % Ethyl alcohol.....	0.8143
48.5 % ".....	0.0875
Chloroform.....	0.1075
Ethyl acetate (81.6 %/o) + alcohol, etc. (10 %/o).....	1.4151

METHYLENE DIOXY BENZAL ACETOPHENONE (Methyl dioxy chalcone)

Freezing-point data are given by Asahina, 1934, 1934A, for mixtures of methylene dioxy benzal aceto phenone and each of the following compounds: p Naphthol, o, m and p Nitrophenols, o Nitro toluene, 2,4,6-trinitro phenol and 2,4,6 Trinitro toluene.

PHENYL VERONAL (Barbital) $\text{NHCONHCOC}(\text{C}_6\text{H}_5)_2\text{CO}$.

100 gms. benzene dissolve 0.057 gm. barbital at 25°. (Warren, 1941.)

" " CCl₄ " 0.007 " " " " " "

Freezing-point data for mixtures of phenyl veronal with antipyrine, with pyramidon, and with sarcosine anhydride are given by Pfeiffer and Seydel, 1928a.

PIPERONAL ACETO PHENONE $\text{CH}_2\text{O}_2\text{C}_6\text{H}_3\text{CH:CHCOOC}_6\text{H}_5$.

Freezing-point data for mixtures of piperonal acetophenone and p 1000 biphenyl are given by Pfeiffer, Schmitz and Inoue, 1929.

METHYL DIPHENYL TRIAZINE $CH_3(C_6H_5)_2C_3N_3$.

Freezing-point data for mixtures of methyl diphenyl triazine with 1,3,5, triphenyl benzene and with 1,3,5-triphenyl triazine are given by Pascal, 1925.

 α BROMO β METHOXY BENZAL ACETO PHENONE $C_6H_5COCBr:C(OCH_3)C_6H_5$

SOLUBILITY OF THE ISOMERS, A AND B
EACH SEPARATELY, IN LIGROIN AND IN ETHYL ALCOHOL.
(Dufraisse and Gillet, 1929.)

Solvent	t°	Gms. per 100 gms. sat. sol.	
		Isomer A (m.pt. 102°)	Isomer B (m.pt. 71-72°)
Ligroin (b.pt. 80°-85°)	19	2.84	2.24
Ethyl Alcohol	19	9.9	6.1 (17°)

BENZOYL TETRA HYDRO QUINALDINE

Freezing-point data for mixtures of the d and l form are given by Adriani, 1900.

VINYL PHENYL CARBINOL p NITRO BENZOATE $C_6H_5CHO(COC_6H_4NO_2)CH=CH_2$.

Freezing-point data are given for mixtures of Vinyl phenyl carbinol p nitro benzoate +

Cinnamic p nitro benzoate (Meisenheimer and Schmidt, 1933.)
Cinnamic, 3,4,5-tri bromo benzoate (Meisenheimer and Schafer, 1933.)

DIPHENYL BUTADIENE

Freezing-point data are given for mixtures of diphenyl butadiene and:

Benzalazine (Pascal, 1914.)
Diphenyl acetylene " "
Diphenyl hydrazine " "
Dimethyl fumarate (Kuhn and Wagner-Jauregg, 1929.)
Picryl chloride " "
Cinnamylidene aniline (Pascal, 1914.)
" β naphthylamine " "

DIBENZOYL ETHANE $(C_6H_5COCH_2)_2$.

Freezing-point data for mixtures of 1,2 dibenzoyl ethane with 1,2 dibenzyl hydrazine and with benzoyl superoxide are given by Grimm, Gunther and Titus, 1931.

DIMETHOXY STILBENE pp' $(CH_3OC_6H_4CH)_2$.

Results for the freezing-points of mixtures of dimethoxy stilbene and tetra methyl diamino benzophenone (Michler's ketone) are given by Pfeiffer, 1924, and Pfeiffer, Goebel and Angern, 1925.

DIXYLYL AMINE (C₆H₅(CH₂)₂)₂N.

Freezing-point data for mixtures of dixyllyl amine with various acids are given by Morgan and Potter, 1935.

METHYLENE BLUE (C₁₆H₁₂N₂NSu₂CH₂NaCl)

100 gm. H₂O dissolve 4.36 gm. methylene

" pyridine " 0.26 "

" 50% pyridine " 0.74 "

Data for the distribution of methylene blue between organic and water are given by Peter Holven (1909).

100 gm. sat. solution of methylene blue in anhydrous compound at 28°. The solid phase in a pure alcohol retains approximately 17% H₂O of H₂O of crystallization. Attempts to reach equilibrium were unsuccessful since the excess solid was not removed after 48 days.

100 gm. sat. solution of methylene blue in at 28° contain 1.47 gm. of the anhydrous compound and Katin, 1941.

AZOPHENETOL (p) (C₆H₅OC₆H₄)₂N₂.

SOLUBILITY IN 100 PER CENT ACETONE

(Dreyer and Rotzski, Chem. Zentr. 76, II, 1915.)

t° →	89.2	91	93	95.6	97.4	99.6
Mols. per liter.	0.153	0.176	0.185	0.202	0.215	0.231

A break in the curve at 91.7° corresponds to the transition of the α modification into the β modification.

Freezing-point data are given for mixtures of azophenetol and

Anisal azoxy phenetol	(Rotinjanz and Rotzski)
p Azoanisole	(Bogojawlousky and Rotzski)
p Azoanisole phenetol	" "
p Azoxy phenetol	" "

HEXADECYL IODIDE CH₃(CH₂)₁₄CH₂I

Freezing-point data for mixtures of hexadecyl iodide and decyl iodide are given by Smith, 1932b.

CETENE (Hexadecane) $C_{16}H_{34}$.**MUTUAL SOLUBILITY OF CETENE AND LIQUID SULFUR DIOXIDE.**
(Seyer and Hugget, 1924.)

The cetene was prepared from spermaceti (cetyl palmitate) by destructive distillation at 300°, and purified by fractional vacuum distillation. The fraction having a melting-point close to that of cetene was redistilled 8 times. The bulb method was used for the determination of the freezing-points and the solubility.

MORPHINE C₁₇H₁₉NO₃·H₂O.

SOLUBILITY OF MORPHINE IN WATER AT 18°.

A detailed discussion and calculation of the dissociation constants of morphine as a base and as an acid is given by Kolthoff, 1922. This author also reports a series of determinations of the solubility of morphine in buffer mixtures composed of 0.2 mol. Na₂CO₃ and 0.2 mol. NaHCO₃. A minimum solubility of 5.6×10^{-4} mols or 0.165 gm. morphine per liter was found at pH 9.1. This is in good agreement with the value of Maus, which is 7.2×10^{-4} mol or 0.141 gm. per liter. The result found by Heiduschka and Faul (1917) for water of conductivity of 5×10^{-6} sec./ohm is 6.1×10^{-4} or 0.181 gm. morphine per liter at 18°. As a mean Kolthoff chooses 5.10^{-4} mol. or 0.157 gm. morphine per liter at 18°.

1000 gms. H₂O sat. with finely powdered morphine base by constant shaking for 2 to 3 weeks at 20° contain 0.195 gm. C₁₇H₁₉NO₃ as determined by titration with 0.01 N HCl using methyl red as indicator.

(Haggenbard, Bachmann and Reimers, 1935.)

SOLUBILITY OF MORPHINE IN WATER AT DIFFERENT HYDROGEN ION CONCENTRATIONS AT 20°.

(Haggenbard, Bachmann and Reimers, 1935.)

An excess of finely powdered morphine base was shaken for periods of 8 to 10 days with a series of buffer solutions of pH varying from 6.2 to 10.3.

The morphine in the saturated filtered solution thus obtained was calculated from nitrogen determinations made by the Kjeldahl method.

TETRA METHYL DIAMINO BENZO PHENONE $N(CH_3)_2 \cdot C_6H_4 \cdot C(=O) \cdot C_6H_3N(CH_3)_2$

Freezing point data are given by Pfeiffer, Goodell and Anger, 1927, for mixtures of tetramethyl diaminobenzophenone and each of the following compounds: anisole, toluene, ethyl acetate, naphthalene, naphthalene, acid, naphthalene, naphthalene, styrene, acid, phenyl acetic acid, resorcinol and salicylic acid. Data for mixtures with formal are given by Pfeiffer and Anger, 1927.

BENZOYL CAMPHOR $C_{15}H_{22}O_2$

SOLUBILITY OF THE ENOLIC AND KETONIC FORMS IN SEVERAL SOLVENTS AT 15°
(M. L. HARR, 1929)

Solvent	Enol form (g. in 100 cc. soln.)	Ketonic form (g. in 100 cc. soln.)
Ethyl Alcohol	1.40	2.95
Acetone	11.0	19.1
Benzene	12.1	16.9

Data, in the form of diagrams, are given by Vassilovska, 1933, for the freezing points and for the solubilities of the enolic and ketonic forms of mono benzoyl camphor in ether, ethyl acetate, alcohol, toluene and acetic acid, at 15°.

Solubility data have been used by Dunroth and Mason (1933) for determining the transition of the tautomeric forms into each other. Results are given for the solubility of each form in ether, acetone, ethylacetate, ethyl alcohol and methyl alcohol.

One liter benzene dissolves 256 gms *enol* benzoylcamphor at 5°, by freezing-point method.

(Calderick, 1933)

COCAINE $C_{17}H_{21}NO$, (Benzoyl cecaine methyl ester)

SOLUBILITY IN WATER. Kolthoff, 1923.

By means of colorimetric determinations of the *pH* of mixtures of 0.01 molecular cocaine hydrochloride and 0.01 normal sodium hydroxide solutions the dissociation constant was calculated to be $K = 6.10 \times 10^{-6}$. For the determination of the solubility product (4), 2 cc. portions of 0.01 molecular cocaine hydrochloride were mixed in tubes of resistance glass with different amounts of 0.01 normal Na OH, shaken and allowed to stand. With 2.0 cc. of 0.01 normal Na OH crystals separated after 4 hours. From this experiment the solubility product was calculated to be $L = 1.10 \times 10^{-6}$ at 15°. The concentration of the undissociated alkaloid in the saturated solution is derived thus,

$$[\text{Cocaine OH}]_{\text{sat.}} = \frac{L}{K} = \frac{1.10 \times 10^{-6}}{6.10 \times 10^{-6}} = 1.80 \times 10^{-2} \text{ mol.}$$

"The concentration of the dissociated part is 10^{-3} mol., so that the total solubility of cocaine in water is 4.10×10^{-2} mol."

TropacOCAINE $C_{18}H_{21}NO$, $C_{10}H_7O \cdot C_8H_9$

SOLUBILITY IN WATER. Kolthoff, 1925.

The dissociation constant was calculated from the colorimetrically determined *pH* curve to be $K = 1.9 \times 10^{-5}$. For the solubility product it was found that 2.0 cc. of a 0.1 molecular tropacocaine hydrochloride solution + 2.0 cc. of 0.01 normal Na OH gave a just perceptible precipitate of tropacocaine after standing a day. The *pH* of the solution was 8.4 corresponding to a *pH* = 5.8 and a $[\text{OH}] = 16.0 \times 10^{-6}$. From the composition of the solution and the hydroxyl ion concentration the solubility product was calculated to be 8.10×10^{-6} . From this and the dissociation constant it was calculated that a saturated solution of tropacocaine in water at 15° has a concentration of 6.4×10^{-2} mol.

TETRA METHYL DIAMINO BENZHYDROL $C_6H_5C_6(CH_3)_4(NH_2)_2CHOH$.

Freezing-point data for mixtures of tetra methyl diamino benzhydrol and benzene are given by Schmidlin and Lang, 1912.

ATROPINE C₁₇H₂₃NO₃

Solubility in Water at 18°. Kolthoff, 1925

The aqueous solution of atropine is very unstable. The compound saponifies to tropin and tropic acid. The solubility diminishes greatly on long shaking. The author obtained constant values after 1 to 2 hours shaking. The saturated solution was filtered and 1 cc. titrated with 0.01*N* HCl using methyl red as indicator. The results correspond to a solubility of 1.5×10^{-2} mol. or 1.50 gm. per liter. The dissociation constant was determined by colorimetric *pu* estimations in 5 cc. portions of a 0.01 mol. C₁₇H₂₃NO₃.HCl solution to which increasing amounts of 0.01*N* NaOH were added. The calculated constant $K = 1.5 \times 10^{-8}$.

ATROPINE C₁₇H₂₃NO₃

SOLUBILITY OF ATROPINE, C₁₇H₂₃NO₃, AND OF ATROPINE SULFATE, (C₁₇H₂₃NO₃)₂.SO₄(OH)₂, IN WATER AND OTHER SOLVENTS.

3 Gms. H_2BO_3 per 100 cc. aq. 50% Glycerol	ord. t.	4			(Barton and Bartholme, 1911)

100 gms. trichlorethylene dissolve 0.014 gm. codeine hydrochloride at 15°.

(Wester and Briggs, 1914)

Data for the solubility of codeine and codeine sulfate in mixtures of alcohols, benzene and chloroform are given by Schaeffer (1913).

100 gms. Pet. Ether dissolve 0.14-0.22 gm. codeine at 25° (Walton, 1913)

100 cc Olive oil dissolve 1.6 gms. codeine at 25° (Walton, 1913.)

CODEINE TRICHLOR ACETATE $C_{18}H_{21}NO_3 \cdot CCl_3COOH \cdot 2H_2O$

100 gms. sat. solution of codeine trichlor acetate in water contain 2.8 gms. of the salt ($7 \cdot 2H_2O$) at 15° and 24.74 gms. at 54.5°. (Florence, 1922)

CODEINE HYDROCHLORIDE $C_{18}H_{21}NO_3 \cdot HCl \cdot H_2O$

100 gms. H_2O dissolve 3.51 gms. $C_{18}H_{21}NO_3 \cdot HCl \cdot H_2O$ at 159.5. (Wilson, 1923)

CODEINE PICRATE $C_{18}H_{21}NO_3 \cdot HO \cdot C_6H_3(NO_2)_3$ (m. pt. 196°-7°)

100 gms. sat. solution { in water contain 0.11 gm. $C_{18}H_{21}NO_3 \cdot HO \cdot C_6H_3(NO_2)_3$ at 20°
of codeine picrate { in abs. alcohol " 0.005 " " " "
{ in acetone " 4.89 " " " "

(Maplethorpe and Rivers, 1925)

BORNYL PHTHALATE Acid-d- $C_{12}H_{19}OOCOC_6H_4COOH$

Freezing-point data for mixtures of the d and l compound are given by Ross and Somerville, 1926.

LINOLENIC HEXABROMIDE $C_{18}H_{29}Br_6O_2$

Qualitative determination of the solubility of linolenic hexabromide and of its Ba, Pb, K and Zn salts in 28 solvents are given by Imperial and West, 1926.

LINOLEIC ACID $C_{18}H_{32}O_2$

Freezing-point data for mixtures of linolenic acid with 100 oleic, with oleic, with palmitic and with stearic acids are given by Kocz and Griegl, 1931.

TriAMYLOSE [C₆H₁₀O₅]₃·4H₂O, β **HexaAMYLOSE** [C₆H₁₀O₅]₆·9H₂O.

SOLUBILITY OF EACH IN WATER.

(Pringsheim and Derniko⁴, 1922.)

The compounds were each dissolved in water by warming and the solutions allowed to stand at 20° until completely crystallized.

100 gms. of the sat. solution of Tri amylose contain 1.39 gms. of the anhydrous compound.

100 gms. of the sat. solution β -Hexa amylose contain 2.40 gms. of the anhydrous compound.

The accuracy of the above results is questioned by Karrer, 1922, who found no difference in the solubility when the finely powdered compounds were shaken with water at the same temperature.

α ELEOSTEARIC ACID C₁₇H₃₁COOH.

SOLUBILITY OF α ELEOSTEARIC ACID IN AQUEOUS ETHYL ALCOHOL AT 0°.

(Ku, 1937.)

Vol. % C ₂ H ₅ OH in aq. solvent	Gms. C ₁₇ H ₃₁ COOH per 100 gms. sat. sol.	Vol. % C ₂ H ₅ OH in aq. solvent	Gms. C ₁₇ H ₃₁ COOH per 100 gms. sat. sol.
54.84	0.023	76.05	0.614
59.61	0.070	80.33	0.983
70.19	0.113	90.14	3.28

100 gms. sat. solution of α eleostearic acid in nitro benzene contain 3.75 gms. C₁₇H₃₁COOH at 0°. (Ku, 1937.)

STEAROLIC ACID CH₃(CH₂)₇C:C(CH₂)₇COOH.

Freezing-point data are given by Rheinboldt and Lauber, 1929, for mixtures of stearolic acid with cholic acid and with hyodesoxy cholic acid.

CHAULMOOGRIC ACID CH:CHCH₂CH₂CH(CH₂)₁₂COOH.

Freezing-point data are given by Cole and Cardoso, 1937, for mixtures of chaulmoogric acid with hydnocarpic acid and for mixtures of hydnocarpic acid with palmitic acid.

RAFFINOSE C₁₈H₃₂O₁₆+ 5H₂O.

SOLUBILITY OF RAFFINOSE IN MIXTURES OF WATER AND PYRIDINE AT 25°.

(Pucher and Dehn, 1921.)

A high degree of accuracy is not claimed for the results. Constant agitation was evidently not employed to insure saturation. The solutions were analyzed by evaporation and weighing the residue.

Per cent C ₅ H ₅ N in solvent.	Gms. Raffinose per 100 gms. solvent.	Per cent C ₅ H ₅ N in solvent.	Gms. Raffinose per 100 gms. solvent.	Per cent C ₅ H ₅ N in solvent.	Gms. Raffinose per 100 gms. solvent.
0.0 (C ₂ H ₅ O)	29.83	60	6.51	92	24.7
10.0	23.12	70	5.32	94	36.9
20	22.16	80	7.40	96	41.9
50	18.88	81.4	4.49	98	45.7
60	13.42	90	24.50	160	79.08
50	9.94	91	24.6		

100 gms. abs. alcohol dissolve 3.6 gms. raffinose at 20-25°.

100 gms. equi. molecular mixture of alcohol and quinoline dissolve 5.04 gms. raffinose at 20-25°.

(Pucher and Dehn, 1921.)

SOLUBILITY OF RAFFINOSE IN WATER

(Reidell, 1910)

°C.	Sol. C ₁₈ H ₃₂ O ₁₆ · 2H ₂ O in 100 cc. water		°C.	Sol. C ₁₈ H ₃₂ O ₁₆ · 2H ₂ O in 100 cc. water	
	gms.	wt.-%		gms.	wt.-%
0.0	4.4	4.4	30	21.4	21.4
10.0	6.2	6.2	40	31.4	31.4
16.38	9.48	10.45	50	46.5	46.5
20.0	12.0	13.0	60	60.6	60.6
25.05	16.28	19.45	70	74.3	74.3
			78.05	84.84	84.84

The solid phase is C₁₈H₃₂O₁₆ · 2H₂O in all cases.

The solubility of raffinose anhydride at 25° is about 1000 gms. per 100 gms. of H₂O and the solution is too viscous to permit a rapid transition to the penta hydrate which is the stable form below 38°.

OLEIC ACID C₁₈H₃₃CH₂CH(CH₂)₇COOH

SOLUBILITY OF OLEIC ACID IN AQUEOUS ALCOHOL SOLUTIONS AT 25°

(Reidell, 1910)

Oleic acid of $d_{25} = 0.8935$ and containing 99.5% acid, determined by titration, was used. It was found that the addition of as little as one drop of this acid to aq. alcohol solutions containing up to 50 wt.-% C₂H₅OH caused an opalescence on shaking, therefore, indicating a solubility of less than 0.05 gm. acid per 100 cc. water or of aq. alcohol. With solutions containing more than 50 wt.-% C₂H₅OH the following results were obtained.

Wt. Percent C ₂ H ₅ OH	cc. Oleic Acid per 100 cc. Aq. Alcohol to produce cloudiness	Remarks
51	0.08 — 0.2	Cloudiness gradually increased
58.2	0.2 — 0.4	" " "
65.5	0.3 — 0.6	Cloudiness disappeared when about 5 cc. acid had been added.
70.2	0.6 — 1	" " " " " " " "
81.4	∞	No cloudiness appeared at all

It was found that although the end points obtained by addition of oleic acid to aq. alcohol mixtures are not sharp, they become so when the procedure is changed to addition of H₂O to mixtures of oleic acid and alcohol. By this method perfectly clear liquid may be transformed by one drop of the H₂O to an opalescent mixture which, after standing a few minutes, separates into two liquid layers. Determinations made in this way gave the following observed and calculated quantities.

Gms. of Constituents to Yield Opalescent Mixtures.			Results Calculated from the Plotted Curve.		
Alcohol + Oleic Acid Mixture	H ₂ O Added to Cause Separation.	Wt. Percent C ₂ H ₅ OH in Aq. Alcohol	cc. Oleic Acid per 100 cc. Aq. Alcohol	Gms. Oleic Acid per 100 Gms. Sat. Sol.	
C ₂ H ₅ OH. Oleic Acid.					
15.30 1.794	10.4	57	0	0	
15.30 3.588	10.2	58.5	0	5	
15.30 4.485	9.8	60	11	12.3	
15.30 7.175	9.25	62.5	30	20	
15.30 11.210	8.05	65	40	30.5	
24.42 22.420	10.10	67.5	60	40	
15.30 20.810	6.50	70	91	50	
1.195 8.969	0.321	75.5	100	68.5	
		80	100	88	

After standing 24 hours the opalescent mixtures separated into layers which, on analysis, gave the results shown in the following table:

COMPOSITION OF UPPER AND LOWER LAYERS OBTAINED BY THE ADDITION OF WATER TO MIXTURES OF AQUEOUS ALCOHOL AND OLEIC ACID AT 25°.

Composition of Original Mixture.

After Separation into Two Layers:

Wt. % C_2H_5OH in Aq. Ale. Used.	cc. Aq. Alcohol Mixture.	cc. Oleic Acid.	cc. H_2O to Cause Separation.	Lower Layer.			Upper Layer.		
				cc. Total Vol.	Sp. Gr.	cc. Oleic Acid.	cc. Total Vol.	Sp. Gr.	cc. Oleic Acid.
70.2	25	2	3.90	29	0.893	1.48	1	...	0.35
70.2	25	4	3.70	26	0.890	1.89	6	0.875	1.98
65.5	26.5	5	1.75	22.7	0.891	1.93	9.3	0.875	2.78
70.2	25	8	2.75	16	0.893	0.98	19	0.876	6.59
70.2	25	12.5	1.55	6	0.890	0.37	33.2	0.878	11.87
70.2	35	25	1	4.5	...	0.28	55.5	0.877	24.14

The C_2H_5OH in the two layers could not be determined on account of excessive foaming during distillation of the neutralized solution. Some losses occurred in transferring the original mixtures to the graduated cylinders and differences between final amounts and those originally present are due to these losses.

SOLUBILITY OF OLEIC ACID IN AQUEOUS ETHYL ALCOHOL AT 0°.

(Ku, 1937.)

Vol. % C_2H_5OH in aq. solvent	Gms. $C_{18}H_{34}O_2$ per 100 gms. sat. sol.	Vol. % C_2H_5OH in aq. solvent	Gms. $C_{18}H_{34}O_2$ per 100 gms. sat. sol.

TRI STEARIN $(C_{18}H_{36}[CH_2(CH_2)_{16}COO]_3)_n$

SOLUBILITY OF TRISTEARIN IN SEVERAL SOLVENTS.

(Hann, 1920.)

The determinations were made by the thermic, the sealed tube and the analytical methods. The author's results were plotted and the following values estimated from the curves.

t°	gms. $(C_{18}H_{36}[CH_2(CH_2)_{16}COO]_3)_n$ per 100 gms. sat. solution in				
	C_6H_6	CH_2Cl_2	$CHCl_3$	CCl_4	C_2H_5OH
5	0.7	—	1.0	—	—
10	1.0	—	1.5	—	0.2
15	1.5	—	2.2	—	0.5
20	—	0.4	10.5	0.02	1.0
25	4.2	0.5	15.0	—	1.5
30	7.0	2.0	20.0	—	4.5
35	12.5	5.5	27.0	—	12.0
40	23.0	11.5	36.0	—	24.5

100 gms Abs. Alcohol dissolve 13.0 gms stearin at 20°C. (Fischer and Dohn, 1921.)

" Quinoline " 5.35 " " "

STEARAMIDE $CH_3(CH_2)_{16}CONH_2$.

Freezing-point data for mixtures of stearamide and palmitamide are given by Guy and Smith, 1939.

STEARIC ANHYDRIDE $(C_{17}H_{35}CO)_2O$.

100 gms. abs. alcohol dissolve 0.023 gm. stearic anhydride at 20°. (Whitby, 1926.)

ETHYL PALMITATE $CH_3(CH_2)_{14}COOC_2H_5$.

Freezing-point data for mixtures of ethyl palmitate with ethyl stearate and with ethyl margarate are given by Smith, 1931.

Ethylene, Propylene, etc. GLYCOL ESTERS.

SOLUBILITY OF STEARIC, AND PALMITIC ESTERS OF ETHYLENE, PROPYLENE AND TRIMETHYLENE GLYCOL IN ABSOLUTE ALCOHOL AT 0° AND 15°.

(Howe, 1918.)

Saturated solutions were prepared at a temperature slightly above 15° and these were kept for 16 hours in a thermostat at 15°. About 10 cc. of the clear supernatant solution were withdrawn, weighed accurately and the alcohol evaporated and the residue dried at 95° and weighed. The remainder of the saturated solution was placed in a mixture of melting ice and kept at 0° in a refrigerator for several hours. The supernatant solution was again analyzed as before.

Results for the solubility of cinchonine and cinchonidine in mixtures of ethyl and methyl alcohols with benzene and with chloroform are given by Schaefer (1913).

It is pointed out by Schaefer (1910), that if the saturated solution is analyzed by shaking out with chloroform or ether, variable results, depending on the age and method of manufacture of the alkaloid, will be obtained.

Except in the case of the results by Sill in the above table, the saturated solutions were obtained by agitating at intervals, instead of constantly at the given temperature.

Results for mixtures of alcohol, chloroform and benzene are given by Scharfer, '13.

Very carefully determined data for the solubility of cinchonine in ethyl alcohol, methyl alcohol, amyl alcohol and acetone solutions of various concentrations of a large number of organic acids and of phenols are given by Sall, 1905.

SOLUBILITY OF CINCHONINE SULFATE IN CHLOROFORM CONTAINING INCREASING AMOUNTS OF ETHYL ALCOHOL.

(Scharfer, 1904.)

An excess of cinchonine sulfate was added to the solvents and the mixtures shaken from time to time at room temperature (20°/1) for 24 hours. The dissolved cinchonine sulfate was determined by evaporation and weighing.

QUININE $C_{20}H_{24}N_2O_2 \cdot 3H_2O$.

SOLUBILITY OF QUININE IN WATER AT 15°. (Kolthoff, 1925.)

The dissociation constants as estimated by the colorimetric titration curve, using 0.01 mol. quinine hydrochloride and 0.01 *n* Na OH, also by means of the quinhydrone electrode, were found to be $K_1 = 1.08 \cdot 10^{-6}$ and $K_2 = 2.10 \cdot 10^{-10}$ at 15°.

The solubility product calculated from a precipitation experiment made by adding just enough of 0.01 *n* Na OH (1.6 to 1.8 cc.) to 5 cc. of 0.05 molecular quinine HCl to give a trace of opalescence, was found to be, $L_{\text{quinine}} = 4.4 \cdot 10^{-9}$. From this and the K_1 dissociation constant the solubility of quinine in water was calculated to be $4.05 \cdot 10^{-3}$ gms. mols. per liter. From another experiment in which 0.01 mol. quinine HCl was used instead of 0.05 mol., a value of $2.10 \cdot 10^{-9}$, corresponding to a solubility of $1.9 \cdot 10^{-3}$ mol. per liter was found. Even this value is, however, too high according to the experiments of Mauz (Dissertation, Stuttgart) who found a saturated solution of quinine in water at 18° to have a concentration of $6.10 \cdot 10^{-4}$ mol. per liter. Other experiments with quinine containing $.3H_2O$ of crystallization gave $6.55 \cdot 10^{-4}$ mol. per liter. From these and the first dissociation constant it is evident that the true solubility of quinine is about $7.10 \cdot 10^{-10}$ mol. per liter.

DISTRIBUTION OF QUININE BETWEEN WATER AND ETHYL ETHER AT 0°.

(Treadwell, 1923.)

To 100 cc. of purified ether + 100 cc. of CO_2 free water, different amounts of purified quinine were added and the mixtures shaken in melting ice for one hour. After separation of the two layers 25 cc. portions of the aqueous layers were conductometrically titrated with 0.005 *n* HCl.

Gms. Quinine per 100 cc.			Gms. Quinine per 100 cc.		
H_2O layer. C_a .	Ethereal layer. C_b .	$\frac{C_1}{\sqrt{C_2}}$.	H_2O layer. C_a .	Ethereal layer. C_b .	$\frac{C_1}{\sqrt{C_2}}$.
0.5611	0.0390	0.0520	1.1142	0.0547	0.0518
0.6274	0.0410	0.0410	1.2378	0.0577	0.0518
0.7074	0.0435	0.0517	1.2901	0.0590	0.0519
0.9013	0.0491	0.0516	1.3457	0.0603	0.0520
0.9083	0.0492	0.0517	1.4281	0.0622	0.0520
1.0018	0.0519	0.0518	1.5387	0.0647	0.0522

The observed C_1 values were plotted on a large scale diagram and the above results read by the author from the curve. The constancy of the ratio $\frac{C_1}{\sqrt{C_2}}$ shows that quinine exists in the ethereal layer in double the size molecules that it has in the H_2O layer.

100 cc. sat. solution of quinine in pure acetone contain 2.32 gms. of the alkaloid at 15°. (Harvey and Back, 1921.)

100 gms Alcohol (Abs.) dissolve 166.6 gms. Quinine at 20-25°.

100 gms. Quinoline dissolve 22.28 gms. Quinine at 20-25°. (Pucher and Dehn, 1921.)

100 gms. Equimol. mixture of Alcohol and Quinoline dissolve 30.04 gms. Quinine at 20-25°. (Pucher and Dehn 1921.)

100 gms. 86.5 % Glycerol ($d = 1.2326$) dissolve 0.33 gms. Quinine at 20°.

" 98.5 " ($d = 1.2645$) " 0.96 " " (Holm, 1921, 1922.)

Hydro QUININE

SOLUBILITY OF HYDROQUININE IN WATER AT 15°. (Kolthoff, 1925.)

The dissociation constant was found to be $K_1 = 4.7 \cdot 10^{-6}$. In determining the solubility product it was found that 10 cc. of 0.005 molecular hydroquinine HCl + 0.1 cc. 0.1 *n* Na OH gave a trace of crystals. The $pH = 8.3$ and the $pOH = 5.9$. From this $L_{\text{hydroquinine}} = 4.10^{-3} \times 1.25 \cdot 10^{-6} = 5.10^{-9}$. From K_1 and L the solubility in water was calculated to be about 0.29 gm. hydroquinine per liter.

SOLUBILITY OF QUININE IN AQUEOUS SOLUTIONS OF CAUSTIC ALKALIES.

(Doumer and Deraux, 1903.)

METHOD.—A one per cent solution of quinine sulfate, containing a very small amount of HCl, was gradually added to 200 cc. portions of the caustic alkali solutions of the various concentrations stated, and the point noted at which a precipitate of the appearance corresponding to that of 1 cc. of milk in 100 cc. of water, remained undissolved.

QUININE IODO BISMUTHATE C₂₀H₂₄O₂N₂(BiI₃)₂·2HI.

SOLUBILITY OF QUININE IODO BISMUTHATE IN ACETONE.

(Picon, 1924.)

Completely dried quinine iodo bismuthate when dissolved in anhydrous acetone forms two layers. The composition of the original salt and of the residue obtained by evaporation of the acetone solution are identical, thus showing that dissociation does not occur. The presence of very small amounts of H₂O increases greatly the amount of salt dissolved; with 4% H₂O two layers are no longer formed. Commercial samples of the salt give results differing from those of the pure compound. Evidence was obtained that the iodo bismuthate combines with six molecules of acetone and the product looses its powder form and becomes a perfectly clear viscous liquid. The iodo bismuthate is soluble in cyclo hexane and in diethylene glycol in all proportions and cyclo hexane can be employed for extracting quinine iodo bismuthate precipitated in aqueous solutions.

QUINIDINE $\text{C}_{20}\text{H}_{24}\text{N}_2\text{O}_2 \cdot ?\text{H}_2\text{O}$.

SOLUBILITY OF QUINIDINE IN WATER AT 18° . (Kolthoff, 1925.)

The first and second dissociation constants, as estimated by colorimetric titration curves of p_{H} , were found to be $K_1 = 3.7 \cdot 10^{-6}$ and $K_2 = 1.0 \cdot 10^{-10}$.

The solubility product of quinidine was determined by adding 0.01 *n* NaOH to 4 cc. of a 0.013 molecular quinidine sulfate solution until a precipitate just appeared after a period of 1 day; 0.08 cc. were required and the p_{H} of the solution was 7.6, hence the $p_{\text{OH}} = 6.6$ and $[\text{OH}] = 2.5 \cdot 10^{-7}$. From this

$$L_{\text{Quinidine}} = [\text{Quinidine} \cdot \text{OH} \cdot] [\text{OH}] = 2.5 \cdot 10^{-9}.$$

Calculating from this and the first dissociation constant the solubility of quinidine in water is $6.7 \cdot 10^{-4} \pm 0.5 \cdot 10^{-4} = 7.2 \cdot 10^{-4}$ gm. mols. per liter.

A saturated solution of quinidine sulfate in water at 18° was found to have a concentration of 0.026 gm. mol. per liter and a p_{H} of 5.9.

METHYL PROPYL AZO PHENOL $[C_6H_2(CH_3)(C_3H_7)OH]_2N_2$.

Freezing-point data are given for mixtures of methyl propyl azo phenol and azo anisol phenetol by Bogojawleusky and Winogradow, 1907.

AMYGDALIN $C_{20}H_{27}NO_3H_2O$.

100 gms. trichlorethylene dissolve 0.029 gm. amygdalin at 15° .

(Wester and Bruins, 1914.)

ELATERIN $C_{20}H_{28}O_6$.

100 cc. 90% alcohol dissolve 0.09 gm. elaterin at $15-20$. (Squire and Caines, 1905.)

100 cc. chloroform dissolve 4 gms. elaterin at $15-20$. " "

ARACHIDIC ACID $CH_3(CH_2)_{18}COOH$.

Freezing-point data are given by von Meyer, Brod and Soyka, 1913, for mixtures of arachidic acid with stearic, palmitic and lignoceric acid.

ETHYL STEARATE $CH_3(CH_2)_{16}COOC_2H_5$.

Freezing-point data are given for:

Ethyl Stearate + Ethyl Margarate (Carey and Smith, 1933.)

" " + Ethyl Palmitate (Smith, 1931.)

HYDROBENZAMIDE $(C_6H_5CH)_3N_2$.

100 gms. absolute alcohol dissolve 1.99 gms. $(C_6H_5CH)_3N_2$ at $20-25^\circ$ (Pucher and Dehn, 1921.)

" quinoline " 3.94 " " "

" equimol mixture of alcohol and quinoline dissolve 2.56 gms. $(C_6H_5CH)_3N_2$ at $20-25^\circ$

TRI BENZYL AMINE $(C_6H_5CH_2)_3N$.

Freezing-point data for mixtures of tribenzyl amine and bromo toluene are given by Paterno and Ampola, 1897.

METHYLENE ANILINE (s Triazine hexa hydro, 1,3,5-triphenyl) $(C_6H_5N.CH_2)_3$.

Freezing-point data for mixtures of methylene aniline and mercapto-benzothiazol are given by Kojima and Nagai, 1931.

HYDRASTINE $C_{21}H_{21}NO_6$.

SOLUBILITY OF HYDRASTINE IN WATER AT 15° . (Kolthoff, 1925.)

From colorimetric pH determinations made in mixtures composed of 0.01 n hydrastine hydrochloride and 0.01 n NaOH solutions the dissociation constant was calculated to be $K = 1.7 \cdot 10^{-8}$. It was found that 5 cc. of hydrastine HCl + 1.0 cc. of 0.01 n NaOH gave a trace of crystalline deposit after one day. The sat. sol. had $pH = 5.7$ and $pOH = 8.5$. From this and other determinations it was concluded that solid hydrastine was in equilibrium with a solution which was $7 \cdot 10^{-3}$ normal with respect to hydrastine salt and had a hydroxylion concentration of $2 \cdot 10^{-9}$. Therefore, the solubility product $I_{hydrastine} = 1.4 \cdot 10^{-11}$ and from this and K the solubility of hydrastine in water was calculated to be $8.2 \cdot 10^{-4}$ mols. per liter at 15° .

SOLUBILITY OF HYDRASTINE AND OF HYDRASTININE HYDROCHLORIDE

IN SEVERAL SOLVENTS.

(U. S. P. VIII; at 18°-22°, Müller, 1903.)

STRYCHNINE C₂₁H₂₂N₂O₂.

SOLUBILITY OF STRYCHNINE IN WATER. (Kolthoff, 1925.)

The dissociation constantes calculated from p_{H} values determined colorimetrically in mixtures of dilute standard solutions of strychnine nitrate and sodium hydroxide, were $K_1 = 10 \cdot 10^{-7}$ and $K_2 = 2.2 \cdot 10^{-12}$. For the determination of the solubility product 5 cc. of 0.025 molecular strychnine nitrate solution gave a faint trace of crystalline precipitate with 0.75 cc. of 0.01 n Na OH solution. The precipitated strychnine was, accordingly, in equilibrium with a 0.02 n strychnine nitrate solution which was found to have a p_{H} value of 6.5. This corresponds to a p_{OH} of 7.7 or a $[\text{OH}]$ of $2 \cdot 10^{-8}$ and the solubility product $L_{\text{strychnine}} = 4 \cdot 10^{-10}$. Calculating from K_1 and L the concentration of a saturated aqueous solution of strychnine is $4.2 \cdot 10^{-4}$ mol. per liter at 15°. A direct determination of the solubility of strychnine in water, made by Mauz, gave $2.7 \cdot 10^{-4}$ mol. strychnine per liter at 15°.

100cc. of sat. sol. of Strychnine in pure acetone contain 0.132 gms. (C₂₁H₂₂N₂O₂) at 15°
 " " " in Ether of $d = 0.720$ " 0.034 " "

(Harvey and Back, 1921.)

100 gms. p cymene dissolve 0.71 gm. strychnine at 30° and 0.95 gm. at 100°.
 (Wheeler, 1920.)

Methyl **CRYPTOPINES**. A, B and C forms, $C_{22}H_{23}O_5N$.

The solubilities of the three forms in benzene, determined by lowering of the freezing-point, are: 5 gms. A form per liter at 5°, 30 gms. B form and 110 gms. C form.
(Sidgwick, 1915.)

NARCOTINE $C_{22}H_{23}NO_7$.

SOLUBILITY OF NARCOTINE ($C_{22}H_{23}NO_7$) IN WATER AT 18°. (Kolthoff, 1925.)

The dissociation constant was found to be $K = 1.5 \cdot 10^{-8}$. The determination was beset with difficulties due to the extremely slight solubility of narcotine. The addition of a trace of alkali precipitates narcotine from a very dilute solution. As the result of many experiments it was found that narcotine was in equilibrium with a narcotine hydrochloride solution which was 0.00092 normal and had a pH of 5.0. That is a pOH of 9.2 or $[OH']$ of $6.4 \cdot 10^{-10}$. From this the solubility product of narcotine $L_{Narcotine} = 9.2 \cdot 10^{-4} \cdot 6.4 \cdot 10^{-10} = 6 \cdot 10^{-13}$. From L and K the solubility in water was calculated to be $4 \cdot 10^{-5}$ mol., corresponding to 0.020 gms. narcotine per liter. A direct determination by Mauz gave 0.0174 gm. per liter.

NARCOTINE PICRATE $C_{22}H_{23}NO_2.OH.C_6H_2(NO_3)_3$.

100 gms. sat. sol. of Narcotine picrate in water contain 0.02 gm of the compd. at 20°.

NARCEINE C₂₂H₂₇NO₈.

SOLUBILITY OF NARCEINE IN WATER AT 18° (Kolthoff, 1925.)

Narceine hydrochloride is so strongly hydrolyzed that it does not dissolve in water. A 0.01 mol. solution yields crystals on cooling. The dissociation constants determined in very dilute solutions were: basic constant $K_b = 2.10^{-11}$, acid constant $K_a = 5.10^{-10}$. Hence narceine is a stronger acid than base. The isoelectric point is near $pH = 6.4$ and here the narceine has a minimum solubility, which was calculated to be $1.3 \cdot 10^{-3}$ mol. per liter.

The solubility product as a base is $L_{\text{Narceine OH}} = [\text{Narc}'] [\text{OH}'] = 2.6 \cdot 10^{-14}$.
 " " an acid is $L_{\text{Narceine H}} = [\text{Narc}'] [\text{H}'] = 6.5 \cdot 10^{-13}$.

ROTENONE $C_{23}H_{22}O_6$

SOLUBILITY OF ROTEONE IN VARIOUS SOLVENTS AT 20°.

(Jones and Smith, 1930.)

The determinations of the concentration of the saturated solutions was based upon the optical activity of the compound. The specific rotation of rotenone in the various solvents was first determined and the concentration of the saturated solution estimated by extrapolation from the values obtained upon solutions of known concentration. The saturated solutions were prepared by constant agitation for 7 hours.

TETRA METHYL DIAMINO TRIPHENYL CARBINOL $C_6H_5COH[C_6H_4N(CH_3)_2]_2$.

Results for the freezing-points of the modifications of this compound from Ether and from Ligroin with tetra methyl diamino triphenyl methyl amine are given by Grimm, Gunther and Titus, 1931.

BRUCINE $C_{21}H_{20}(OCH_3)_2N_2O_2 \cdot 4H_2O$.

Kolthoff, 1925, reports that the solubility of brucine in water, as determined by Mauz (Dissertation, Stuttgart, 1904), using the $4H_2O$ compound is $1.33 \cdot 10^{-3}$ gm. mol. per liter. From this value and the first dissociation constant ($K_1 = 9.2 \cdot 10^{-7}$) he calculates the solubility product of brucine to be

$$L_{\text{brucine}} = 9.2 \cdot 10^{-7} \times 1.33 \cdot 10^{-3} = 1.22 \cdot 10^{-9}.$$

SOLUBILITY OF BRUCINE IN MIXTURES OF ALCOHOL AND QUINOLINE AT 20-25°.

SOLUBILITY OF CHOLESTEROL IN AQUEOUS BILE SALT SOLUTIONS AT 37°.

(Bashour and Bauman, 1937.)

Recrystallized commercial cholesterol in large excess was constantly shaken with the bile salt solutions for 4 days. After standing 2 days the supernatant solution was filtered and the dissolved cholesterol determined by a modified gravimetric method and the total solids by evaporation and drying at 100° and at 138°. The bile salts were prepared by titration of the bile acids in dilute alcoholic solution with sodium hydroxide, evaporating to dryness and recrystallizing. The results are given only in the form of a diagram from which the following approximate values were estimated.

Gms. Bile salt per 100 gms. aq. solution	Gms. Cholesterol dissolved per gram of (Sodium):

SOLUBILITY OF STEARIC ACID ESTER OF CHOLESTEROL IN OILS AT 37° AND VICE VERSA. (Filehne, 1907.)

The determinations were made by adding small weighed amounts of the ester to the oil at 60° and cooling to 36-37° while stirring continually. The additions of the ester were repeated until a clouding just appeared at 36-37°. In the case of the solubility of the oils in cholesterol, the composition of the sat. solution was estimated by means of the specific gravity and the melting point.

VERATRINE (Cevadine) $C_{32}H_{49}NO_9$.

SOLUBILITY OF VERATRINE IN WATER. (Kolthoff, 1925.)

The *dissociation constant* was calculated from colorimetric pH measurements in mixtures of 0.01 *n* veratrine hydrochloride and 0.01 *n* Na OH to be $K = 7.2 \cdot 10^{-6}$. It is, therefore, a fairly strong base. For the determination of the *solubility product* it was found that a mixture of 5.0 cc. of 0.05 *n* veratrine hydrochloride + 0.8 cc. 0.01 *n* Na OH gave no precipitate after standing 1 day. With 0.9 cc. 0.1 *n* Na OH a crystalline deposit appeared. The pH of the saturated solution was 8.5. The $[OH] = 2 \cdot 10^{-6}$. The veratrine salt conc. = $3 \cdot 10^{-2}$ *n* and the calculated solubility product, $L_{\text{veratrine}} = 6 \cdot 10^{-8}$. From *K* and *L* the solubility of veratrine was calculated to be $8 \cdot 10^{-3}$ gm. mols. per liter at 15°.

SOLUBILITY OF VERATRINE IN SEVERAL SOLVENTS.

ACONITINE C₃₄H₄₅NO₁₁.SOLUBILITY OF ACONITINE IN WATER AT 15°.
(Koltzoff, 1925.)

The author first determined the dissociation constant of aconitine. For this purpose the p_{11} values were estimated colorimetrically for a 0.01 molecular solution of aconitine chloride to which increasing amounts of 0.01 normal NaOH were added. From this series of determinations the dissociation constant K , for aconitine was found to be $1.3 \cdot 10^{-6}$.

The solubility product was next estimated by adding 0.1 cc. of 0.01 normal NaOH to 5.0 cc. of 0.01 molecular aconitine chloride solution, and after seeding, allowing to stand 24 hours. Only a very slight precipitation occurred and it was concluded that the aconitine was in equilibrium with a solution which was $8 \cdot 10^{-3}$ normal with respect to aconitine chloride and had a hydroxyl ion concentration of $6.4 \cdot 10^{-8}$. These values correspond to a solubility product of $5 \cdot 10^{-10}$. The solubility is, therefore, $5 \cdot 10^{-10} \div 1.3 \cdot 10^{-6} = 4 \cdot 10^{-4}$ or 260 milligrams aconitine per liter.

The author also states that he found a saturated solution of *Aconitine Nitrate* in water to have a concentration of $2.6 \cdot 10^{-4}$ mol. per liter at 15°.

ACONITINE (Amorphous) C₃₄H₄₇NO₁₁.

INULIN (C₆H₁₀O₅)₆ · H₂O.

SOLUBILITY OF INULIN IN WATER.

(Yanovsky and Kingsbury, 1933.)

The saturated solutions were prepared by intermittent shaking by hand and analyzed on successive days for reducing sugars and inulin. Equilibrium was approached very slowly. The results indicate that inulin from the dahlia and from chicory each exist in two modifications. One of the modifications of chicory inulin is unstable and gradually changes to the less soluble form.

SOLANINE $C_{32}H_{53}NO_{18}$.

SOLUBILITY OF SOLANINE IN WATER AT 15° .

(Kolthoff, 1925.)

This alkaloid is extraordinarily insoluble. In order to determine its *dissociation constant*, the pH was measured colorimetrically in mixtures of 5 cc. of 0.0108 n solanine chloride solution + 50-100 cc. of water + 0.54 to 2.7 cc. of 0.01 n Na OH. From these measurements it was calculated that $K = 2.2 \cdot 10^{-7}$. For the determination of the *solubility product* it was found that a mixture of 5 cc. of 0.0108 n solanine chloride solution, 50 cc. of water and 0.5 cc. of 0.01 n Na OH just gave a slight precipitate on standing. The pH of the solution was 6.0 and the calculated $(OH) = 6.4 \cdot 10^{-9}$. From this the solubility product $L_{\text{Solanine}} = 6.4 \cdot 10^{-12}$. Calculating from L and K the solubility of solanine in water corresponds to a concentration of $3 \cdot 10^{-6}$ mol. or about 0.025 gm. per liter.

ALOIN.

Squires and Caines (1905) found the solubility of aloin in water at room temperature to be 0.83 gm. per 100 cc. and in 90% alcohol, 5.55 gms. per 100 cc.

According to Wester and Bruins (1914) 100 gms. trichloroethylene dissolve 0.013 gm. aloin at 15° .

CARMINE.

100 gms. H_2O	dissolve 0.13 gm. carmine at $20-25^{\circ}$.	(Dehn, 1917.)

"

100 cc. 50% aq. pyridine dissolve 62.5 gms. helianthin.

"

Results for other solvents and observations on the state of colored compounds in solution are given.

DYES.

Data for the distribution of 12 dyes between water and isobutyl alcohol at 25°, are given by Reinders and Lely, Jr. (1912).

Data for the solubility of thirty new azo dyes similar to oil scarlet, in carbon tetrachloride and in toluene are given by May and Hunt, 1928.

Data for the solubility of yellow AB (benzene-azo-β Naphthylamine) and of scarlet X 9995 (benzene-azo-β Naphthol), in aqueous solutions of stable protective colloids (soap or other detergents) are given by McBain and Woo, 1938.

FATS, OILS and WAXES.**CRITICAL SOLUTION TEMPERATURES OF FATS AND OILS IN GLACIAL ACETIC ACID.**

(Grimme, 1919, 1920.)

When a solution of a fat in a suitable solvent cools, it is observed that at a given temperature, which depends both upon the solvent and the nature of the selected fat, a sudden cloudiness of the solution develops. The temperature at which this takes place is the **CRITICAL SOLUTION TEMPERATURE**. The author gives a review of previous work upon this determination and subjects the method to a critical study. He used glacial acetic acid instead of alcohol in order to be able to work with open tubes instead of closed ones. He also tested the effect of cooling with and without an air bath. It was found that a bath of glycerol cooled so slowly that too much time was required for the determinations.

Critical temperature of solution using:

1 gm. of oil + 5 cc. of solvent were employed for each determination. The cocoanut oil contained 0.032 % of fatty acids and the palm kernel oil, 0.060 per cent. The critical solution temperatures of various mixtures of the two oils are also given.

SOLUBILITY OF SEVERAL OILS IN ALCOHOL ($d_{15}^{20} = 0.795$) AT 14-15°.

(Davidsohn and Wrage, 1915.)

Oil.	Gms. Oil per 100 Gms. Sat. Sol.
Linseed Oil	3.32
Rape Oil	1.36
Cotton Seed Oil	3.61
Olive Oil	2.25

Results are also given for the solubility of mixtures of oils and fatty acids in alcohol. The following results at 22°, in terms of approx. volume of oil dissolved by 100 volumes of 80% alcohol, are given by Aubert (1902). Nigella oil, 4.3; oil of boldo leaves, more than 100; matico oil, about 20; cascarrilla oil, 5; weld-mint oil, 66.

Miscibility curves for various oils with acetone, petroleum and aniline are given by Louise (1911). The use of this data for the identification of oils and the detection of adulteration in the edible oils has been discussed by Louise (1911).

Results for the solubility temperatures of separation of mixtures of Castor Oil (alone and containing up to 10% of Sesame oil) and 89.9 Vol.% Ethyl alcohol are given by Meerburg, 1929.

Data showing the miscibility at 25° of 90% and of absolute Ethyl Alcohol with the following oils; almond, apricot kernel, China wood, cod liver, corn, linseed, neat's foot, olive, peach kernel, rape seed, sesame, soy bean, sunflower, walnut and whale, are given by Taylor, Larson and Johnson, 1936.

Data for the reciprocal solubility of sulfonated castor oil, mineral oil and oleic acid are given by Hart, 1929.

SOLUBILITY OF SEVERAL VOLATILE OILS IN AQUEOUS ALCOHOL AT 22-25°.

(Wood, 1920.)

The determinations were made by gradually adding water to an alcoholic solution of the oil until opalescence appeared. Since the volatile oils are mixtures the results are of only approximate accuracy.

Per cent concentration of alcohol.	Cc. of each oil (determined separately), soluble in 100 cc. of alcohol of the concentration shown in the first column.

It is pointed out by Fontein, 1923, that the H₂O in the SO₂ used, affects the temperature of demixing.

An extensive series of observations on the solubility of water in oils and on the water content of various oils is given by Umney and Bunker (1912).

Freezing-point data for oil of helianthus annus + stearic acid are given by Fokin (1912).

WAXES

Diagrams and numerical data are given by Pickett, 1929 for the solubility of Bees wax, Candelilla wax, Carnauba wax and Montau wax, each separately, in naphtha, turpentine, No. 22 thinner, (terpene hydro carbons + gasoline) solvenol (terpene hydro carbons + saturated hydro carbons), pine oil, sulfonated castor oil and mixtures of pine oil and sulfonated castor oil.

The effect of variations in procedure upon the solubility of Shellac in diethyl ether is reported by Gardner and Harris, 1934, and used as an illustration of the misleading results which are obtained unless precautions are taken to avoid important sources of error.

GASOLINE (Petrol. Essence) See also Heptane and Hexane.

SOLUBILITY OF MOTOR GASOLINE (66° Be) AND CASING HEAD GASOLINE (81° Be) IN WATER AT 25°. (Milligan, 1924.)

Gasoline vapor mixed with air was shaken for 2 minutes with distilled water previously saturated with air. The mixture was analyzed by means of a Haldane gas analysis apparatus before and after contact with water, and the amount of gasoline dissolved by the water found by difference. The solubility coefficient α_{25} represents the volume of gas (reduced to 0°) which dissolves in one volume of water at 25° when the pressure of the gas over the water is 760 mm.

Using motor gasoline (66° Be) of average composition C_7H_{14} (Heptane) the result was $\alpha_{25} = 0.017$.

Using casing head gasoline (81° Be) of average composition C_6H_{14} (Hexane) the result was $\alpha_{25} = 0.012$.

From these values for gasoline vapors, corresponding in composition to heptane and hexane, the solubility of liquid heptane and hexane in water at 25° was calculated to be approximately 0.0007 and 0.0014 volumes, respectively, per 100 volumes of H_2O .

SOLUBILITY OF MIXTURES OF GASOLINE AND BENZENE AND OF GASOLINE AND XYLENE IN 92 WT. PER CENT ETHYL ALCOHOL AT 20°. (Ormandy and Craven, 1921.)

Gasoline**+ Benzene Mixtures.**

Similar results for mixtures of ether and xylene and ether and kerosene are also given.

PETROLEUM ETHER.

100 cc. H_2O dissolve 0.005 cc. petroleum ether at 15°.

(Groschuff, 1910.)

LIGRÖIN.

100 cc. H_2O dissolve 0.341 cc. ligröin at 22°, Vol. of solution = 100.34, Sp. Gr. 0.9969.

100 cc. ligröin dissolve 0.335 cc. H_2O at 22°, Vol. of solution = 100.60, Sp. Gr. 0.6640.

(Herz, 1898)

PETROLEUM

Qualitative data upon the miscibility of samples of Pennsylvania and Texas petroleum oil and of paraffin wax with 27 solvents at 10°, 21°, and higher temperatures are given by Poole, 1929. Similar results for an additional 26 solvents are given by Poole and others, 1931. These and many quantitative results show that the number of solvents which may be used for dewaxing is very large.

Quantitative results are given by Poole, 1929, for the solubility of lubricating oils and of paraffin wax in acetone, butanol, ethyl acetate, butyl acetate, chloro benzene and toluene.

Quantitative determinations of the solubility of Pennsylvania petroleum and of paraffin wax in naphtha, turpentine, ethylene dichloride, methyl ethyl ketone, n butyl aldehyde, iso propyl alcohol, n amyl alcohol, alcohol, pentasol and paraldehyde, as well as results showing the effect of petroleum oil upon the solubility of paraffin wax in butanol, butyl acetate and chloro benzene are given by Poole and others, 1931. The results are useful in permitting the separation of paraffin wax from liquid hydro carbons by solubility differences.

Results showing the effect of temperature and of oil-solvent ratio upon the solubility of paraffin wax in butyl formate, n butyl aldehyde and diethyl carbinol are given by Poole and Mangelsdorf, 1932.

SOLUBILITY OF PETROLEUM IN LIQUID SULFUR DIOXIDE.

(Zerner, Weiss and Opalski, 1922.)

Mixtures of known amounts of the two products were sealed in resistance glass tubes and the temperatures determined at which a homogeneous mixture or slight clouding occurred. The SO₂ consisted of 98.85 % SO₂, 0.56 % H₂O and 0.67 % oily residue. The petroleum was an American commercial sample which began to boil at 175°; 30.9 % distilled at 175°-200°, 47.9 % at 200°-225° and 15.6 % at 225°-250°. The $d_{15} = 0.8102$ and $n_{D}^{15} = 1.4514$.

The solutions were colored yellow to brown. At lowest concentrations of SO₂ a brown resin separates.

The above experiments are criticised by Fontein, 1923 who points out that the water present in the SO₂ affects the temperature of demixing.

The use of sulfur dioxide in the refining of petroleum is discussed in detail by Edeleanu, 1923.

PARAFFINS.

Data for the solubility of several samples of paraffin in a large number of solvents are given by Sachanen, 1925. The samples of paraffin varied in melting-point from 41°-42°, 53 1/2°-55°, 56°-57°, 57°-58 1/2° and 78°-80°. The solvents included benzene, kerosene, paraffin oil of several densities, machine oil, mazout (containing and free from paraffin) benzoin, abs. alcohol, methyl alcohol and iso amyl alcohol. In each case the solubility begins at less than 1 per cent at a temperature of 0° or less and rises very rapidly to 50 per cent or more with increase of temperature to about 50°.

PARAFFINS

SOLUBILITY OF PARAFFIN WAX IN PURE HYDROCARBONS.

(Weber and Dunlap, 1928.)

The sample of paraffin wax was carefully recrystallized three times from benzene. That part which first crystallized was taken for the next crystallization each time. The final sample was about 25 percent of the original amount. This product undoubtedly contained several constituents. Its melting point was 56° and density at $20/40^\circ = 0.775$. The hydrocarbons were very carefully purified.

Hydrocarbon	b.pt.	$d_{40}^{20^\circ}$	Gms. Paraffin dissolved per 100cc Hydrocarbon at:

The curves of solubility of a commercial paraffin wax from mid-continent crude petroleum, and of several samples obtained by repeated fractionation of this paraffin, in petroleum ether and in a number of mid-continent petroleum oils of varying viscosities, are reported by Sullivan, McGill and French, 1927. It was found that the solubility of paraffin waxes increases as the melting point of the wax decreases. The solubility decreases with increasing viscosity of the solvent. These differences were found to be less at the lower temperatures.

Determinations of the solubility relations of commercially refined paraffin waxes in petroleum distillates are reported by Berne-Allen and Work, 1938. It was found that the average boiling-points of the petroleum fractions and the melting-points of the paraffin waxes are directly related to the molecular weights of the solvents and solutes respectively. An empirical equation was established to express the relationship between m. pt. of the wax, b. pt. of the solvent and the solution temperature equilibrium.

SOLUBILITY OF OZOKERITE PARAFFIN OF MELTING POINT 64° - 65° ANDSP. GR. AT $20^\circ = 0.917$ IN SEVERAL SOLVENTS AT 20°

Freezing-point data for mixtures of paraffin and naphthalene and paraffin + stearin are given by Palazzo and Battelli (1883).

CELLULOSE ESTERS

SOLUBILITY OF CELLULOSE ESTERS IN VARIOUS ORGANIC SOLVENTS.
(Mardles, 1923.)

"Cellulose esters dissolve in numerous organic liquids to form clear, viscous, colloidal solutions, from which the ester can be recovered unchanged. Some liquids appear to be better solvents than others, dissolving the cellulose acetate more rapidly and yielding less viscous solutions. Similarly a mixture of liquids often forms a better solvent than either taken singly." Saturation cannot be obtained in the ordinary way on account of the rapid rise of viscosity with concentration. The author has chosen a method based upon the observation of Schützenberger (*Compt. rend.*, 68, 814, 1869) that the triacetate of cellulose dissolves in nitrobenzene on warming and precipitates in a gelatinous form on cooling the solution. "The method of observing this transition temperature of the dispersion medium, from a complete solvent to a partial or non-solvent, has been used to appraise the relative solvent powers of liquids for cellulose esters. The point of precipitation is marked by the appearance of turbidity or opalescence, as in the case when a mixture of liquids is cooled below the temperature of complete miscibility, indicating the transition from a true solution to a coarse dispersion." About 5 cc. of a solution of a concentration of 5 grams per 100 cc., contained in a test-tube, was cooled with stirring, and the temperature noted at which opalescence appeared.

Cellulose nitroacetate in benzyl alcohol (5 gm. per 100 cc.) gives opalescence at 25° and at higher temperatures, depending upon the nitrogen content of the sample.

The author found that for very dilute solutions the temperature of opalescence rises with concentration, but eventually remain nearly constant over a wide range of concentration, and then falls with further increase.

Data for the solubility in binary and ternary systems of solvents are also given

An indirect method of determining the solubility consists in comparing the effect upon various solvents of the addition of different amounts of an indifferent miscible non-solvent, such as petroleum ether, upon the temperature of precipitation of the cellulose ester. The non solvent, which was usually the heptane fraction of petroleum spirit, was added from a buret to about 5 cc. of the solution (of 5 gms. per 100 cc.) contained in a test-tube kept at 20°, untill the incipient turbidity persists. An extensive series of such measurements is given.

NITROCELLULOSE (Soluble Pyroxylin, Tetra and Penta Nitrate).**SOLUBILITY IN ETHER-ALCOHOL MIXTURES.**

(Matteoschat, 1914; see also Stepanow, 1907.)

A sample of gun cotton containing 12.95% N was used. The compound was first covered with alcohol and then the amount of ether to yield the desired composition of solvent was added. Lower results were obtained with ready prepared ether-alcohol mixtures.

Ratio of Ether : Alcohol.	Gms. Gun Cotton Dissolved per 100 Gms. Solution in Mixtures Prepared with:

3 : 1	25	42.4	53	57.5

NITROCELLULOSE.

Experiments upon the solubility of nitrocellulose in mixtures of alcohol and ether are described by de Bruin, 1921, and in mixtures of alcohol and ethylacetate by Wilkie, 1921. It was found by de Bruin that the solubility decreased as the per cent of nitrogen in the sample increased. 384 samples were tested with the following results.

Mean per cent of N..	11.38	12.25	12.45	12.64	12.74	12.85	12.93	13.19
Mean solubility.....	97.5	95.6	85.6	66.8	48.2	34.3	23.8	8.2

The exact terms in which the results are given are not-stated. The solvent consisted of approximately 33 vol. per cent C_2H_5OH and 66 vol. per cent $(C_2H_5)_2O$. It was found by Wilkie that four different samples of nitrocellulose each showed a slight maximum solubility in a mixture of about 60 per cent ethyl acetate in alcohol, but the differences between the several samples were greater than the variations in solubility of any sample in increasing concentrations of ethyl acetate in alcohol.

TURPENTINE OIL**SOLUBILITY IN ETHYL ALCOHOL.**

(Vezes and Mouline, 1904, 1905-06.)

Spirit of turpentine and absolute alcohol are miscible in all proportions and the mixture may be cooled to a very low temperature without ceasing to be homogeneous. In the case of alcohol containing a small amount of water, the mixture, which is uniform at ordinary temperature, separates into two layers when cooled. The following data were obtained for mixtures of 98 vol. % alcohol (= 0.968 gm. C_2H_5OH per 1 gm. aq. alcohol) and spirits of turpentine and for mixtures of 95 vol. % alcohol (= 0.924 gm. C_2H_5OH per 1 gm. aq. alcohol) and spirits of turpentine.

The comparative qualitative solubility characteristics of caoutchouc (balata, gutta, gutta-percha, polyisoprene, polyvinyl acetate, poly isopropyl methyl acrylate, polyvinyl acetate) in CCl₄, CHCl₃, CCl₄, C₆H₆, CH₃COCH₃, benzene, tetralin, toluene, pyridine, ether, acetone dioxan, methyl acetate, methyl alcohol and acetic acid, and for polystyrene and polyvinyl acetate, are given by Steudinger and Hesse, 1934. The authors also give results for the precipitability of polymers of molecular weight 60,000 and 140,000 in various solvents, by the addition of methyl alcohol and of acetone, and the precipitability of a series of polymers of molecular weight 2400 to 250,000 dissolved in benzene and in methyl ethyl ketone, by the addition of methyl alcohol and of ethyl alcohol.

EDESTIN.

SOLUBILITY OF EDESTIN IN AQUEOUS SOLUTIONS AT 25°. (Kodama, 1922.)

Crystalline edestin, prepared from hemp seed by the method of Osborne, was used. Into a series of flasks, 0.05 gm. edestin and 10 cc. portions of aqueous HCl or Na OH solutions of various concentrations were placed. The mixtures were kept in a thermostat at 25° for 30 minutes. The p_H was determined by Clark's method. The mixtures were filtered and the dissolved edestin in the filtrates determined nephelometrically. The results show that edestin dissolves as the HCl salt in solutions more acid than p_H 5.9 and as the Na OH salt in solutions more alkaline than p_H 8.0. Between p_H 5.9 and 8.0 the amount dissolved could not be detected by the nephelometric method. The iso electric point of edestin is at p_H 5.9. Neutral Na Cl solutions dissolve edestin only when the concentration of Na Cl is greater than 2.0 normal and the acidity of the solution not more than p_H 5.9.

EDESTIN and Edestin Salts.

SOLUBILITY IN Aq. SALT SOLUTIONS AT 25°.

(Osborne and Harris, 1905.)

The determinations were made by shaking an excess of the air-dry preparation with 20 cc. of the salt solution, allowing the globulin to settle and determining nitrogen in 10 cc. of the clear supernatant solution. The edestin or edestin salt was calculated from the N. The results are given in the form of curves. The following figures were read from the curve for the solubility of neutral edestin in aq. NaCl.

Gms. NaCl per 20 cc. Solvent. \rightarrow 0.468 0.585 0.702 0.818 0.935
 Gm. Edestin per 20 cc. Sat. Sol. \rightarrow 0.25 0.55 0.92 1.25 1.45

Curves are also given for the solubility of edestin in aqueous solutions of many other salts and of the solubility of edestin chloride, bichloride and sulfate in aq. sodium chloride solutions.

100 gms. pyridine dissolve 0.07 gm. edestin at 20-25°.

(Dehn, 1917.)

100 gms. aq. 50% pyridine dissolve 9.05 gm. edestin at 20-25°.

"

ZEIN (Protein from Corn).

SOLUBILITY IN AQUEOUS ALCOHOL SOLUTIONS AT 25°.

(Galeotti and Giampalmo, 1908)

Dry powdered zein was added to the alcohol + water mixtures and the solutions kept at 25° and shaken frequently during 24 hrs. The removed undissolved residue was dried to constant weight and weighed.

Vol. % C_2H_5OH in Solvent.	Gms. Zein per 100 Gms. Sat. Sol.	Vol. % C_2H_5OH in Solvent.	Gms. Zein per 100 Gms. Sat. Sol.
10	0.05	60	18.57
20	0.11	70	19.87
30	0.21	80	7.81
40	0.51	90	4.51
50	1.43	100	0.02

Similar results are given for the solubility of zein in mixtures of $C_2H_5OH + H_2O$ + $CHCl_3$ at 20° and $C_2H_5OH + H_2O$ + acetone at 25°.

GLIADIN.

SOLUBILITY OF GLIADIN IN AQUEOUS SOLUTIONS OF ACIDS AT 25°. (Tague, 1925.)

The gliadin was prepared from wheat flour by the method of Osborne. One gram per 100 cc. of aqueous acid, containing 5 drops of toluene, were constantly shaken for 8 hours. The mixture was allowed to stand over night and the nitrogen determined in 100 cc. of the clear filtrate. The factor 5.7 was used to convert nitrogen to gliadin.

Normality of aq. acid solution.	Grams of Gliadin per 100 cc. of sat. solution in aq.		
	H Cl.	H ₂ SO ₄ .	CH ₃ COOH.
1.0	0.0550	0.0632	0.1733
0.1	0.0661	0.0741	0.1654
0.01	0.1397	0.1208	0.1309
0.001	0.1357	0.1265	0.1117
0.0001	0.0966	0.0890	0.0816
0.00001	0.0700	0.0716	0.0761

Since the method of preparation and purification has a great deal to do with the physical and chemical characteristics of proteins, the author determined the solubility in aqueous H Cl, of three samples of gliadin prepared by slight modifications of the method of preparation.

Normality of aqueous H Cl.	Gms. Gliadin per 100 cc. sat. solution		
	Sample No. 1	Sample No. 2	Sample No. 3
1.0	0.0496	0.0550	0.0442
0.1	0.0584	0.0600	0.0613
0.01	0.3554	0.1207	0.2428
0.001	0.3348	0.1254	0.1972
0.0001	0.1699	0.1083	0.0452
0.00001	0.0923	0.0938	0.0962

The author also gives data which show that :

Moist gliadin is about twice as soluble as dry gliadin.

The amount of gliadin dissolved varies directly with the amount of excess of solid material used for preparing the saturated solution. With 5.0 gms. per 100 cc of solvent there is from 3 to 4 times as much dissolved as when 1.0 gm. per 100 cc. is used.

The solubility increases with time of shaking up to about 72 hours.

The maximum solubility occurs at pH 2 to 3 and the minimum at pH 6.5.

Gliadin is slightly soluble in aqueous sodium carbonate solution, with maximum at about 0.009 molar.

The solubility in aqueous solutions of neutral salts is only about 0.001 gm. per 100 cc., except with $MgCl_2$ solutions, in which it may reach 0.084 gm. per 100 cc. in concentrated solutions.

Gliadin is quite soluble in aqueous methyl alcohol; the maximum being 0.1322 gms. per 100 cc. in alcohol of 70 volume per cent.

SOLUBILITY OF GLIADIN IN AQUEOUS SOLUTIONS OF ETHYL ALCOHOL.

(Bill and Alsberg, 1925.)

Solutions of gliadin and the solvent in sealed tubes warmed to 50°, were cooled very gradually and the temperature observed at which turbidity appeared. For each solvent this temperature was practically independant of the gliadin concentration.

Concentration of Gliadin in gms. per 100 gms. solution.	Temp. of appearance of turbidity in aq. Alcohol of

« The phenomenon appears to be one of peptization rather than of true solution ».

The authors also give determinations of the solubility (peptization) of gliadin in aqueous solutions of other compounds. The results show the minimum concentration (mols. per liter) of each compound in water, capable of holding gliadin in solution at 20°, as determined by dilution. KSCN, 1.06; NH_4SCN , 1.09; KI, about 5.0; Urea, 2.03; CH_3OH , 12.1; C_2H_5OH , 5.8; nC_3H_7OH , 2.28; isopropyl alcohol, 4.7; chloral hydrate, 3.0.

CASEIN.

The solubility of Casein in water at its iso electric point (pH 4.6) is 0.11 gms. per liter at 25°. (Cohn, 1922, 1923.)

SOLUBILITY OF CASEIN IN DILUTE SOLUTIONS OF SODIUM CHLORIDE AT 18-22°.

(Hyd, 1917.)

An accurately weighed amount of highly purified casein was dissolved in an accurately measured amount of CO_2 free NaOH solution, in an apparatus provided with an efficient stirrer and into which measured amounts of standard NaOH and HCl solutions could be introduced from burets. Provision was made to prevent the introduction of CO_2 . An amount of HCl equivalent to the NaOH present was added. If too much casein was present the opalescence and precipitation occurred before the neutral point was reached. If, on the other hand, too little casein was present more acid could be added than corresponded to the used amount of NaOH without causing opalescence. By alternate additions of NaOH and HCl the point could finally be obtained where the last added drop of HCl just produced opalescence. A series of such determinations gave the following results :

Mols NaCl per liter.	Gms. Casein per liter.	Mols NaCl per liter.	Gms. Casein per liter.	Mols NaCl per liter.	Gms. Casein per liter.

SOLUBILITY OF ACID PRECIPITATED CASEIN IN AQUEOUS SALT SOLUTIONS. (McKee and Gould, 1928.)

The sample of casein was prepared by precipitating skim milk with HCl at a pH of 4.1. Since the solubility of casein varies with the excess present in contact with the sat. solution (thus showing the non-homogeneity of casein), all determinations were made with 5 gms. per 50cc of solution and 0.2% phenol was used to prevent bacterial decomposition. All determinations were made at pH 4.6, the iso electric point of casein. The amount of dissolved casein in the filtered saturated solution was determined by precipitation with acetic acid at 35-40°, allowing to stand over night, filtering, washing, drying and weighing.

SOLUBILITY OF CASEIN IN AQUEOUS SOLUTIONS OF SALTS AND ACIDS. (von Euler and Bucht, 1923.)

An excess of casein was shaken with 50 cc. portions of the aqueous solutions for 2 or 4 hours. The temperature is not stated. The dissolved casein was determined by the addition of sodium acetate or acetic acid and filtering the precipitate and drying in a vacuum over H_2SO_4 , and then in an ordinary desiccator over solid Na OH.

 " quinoline " 0.38 " " "
 " equi molecular mixture of alcohol and quinoline dissolve 0.92 gms. casein at 20-25°.

100 gms. H_2O dissolve 2.01 gms. casein at 20-25°. (Dehn, 1917.)
 100 gms. pyridine dissolve 0.09 gm. casein at 20-25°. "
 100 gms. aq. 50% pyridine dissolve 0.56 gm. casein at 20-25°. "

An abstract of experiments on the solubility of casein in dilute acids is given by Van Slyke and Winter (1913). Results for the solubility of casein in aqueous solutions of KOH, LiOH and $Ca(OH)_2$ at various temperatures, are given by Robertson, 1908

GELATIN**SOLUBILITY OF GELATIN IN WATER AND IN AQUEOUS SOLUTIONS
OF ACIDS AND BASES AT 15°-17°. (Fairbrother and Swan, 1922.)**

One gram quantities of gelatin in 3/4 inch squares were placed in conical flasks of 250 cc. capacity together with a few crystals of thymol and 100 cc. of the aqueous solution. The flasks were shaken gently once each day for ten days. The supernatant liquid was filtered through paper and the first two 20 cc. portions of filtrate were rejected. The third 20 cc. portion was neutralized, using methyl red as indicator. It was diluted to 40 cc. with H_2O and 20 cc. of a 1 % solution of tannin were added. The precipitate was kept at 0° for 1/2 hour, filtered upon a tared filter, washed with water to remove excess of tannin and then dried at 100° and at 105° and weighed. The method was controlled by means of determinations upon quantities of gelatin between 0.001 and 0.080 gm. per 20 cc. The sample of gelatin employed for the solubility determinations was Coignet's Gelatin Extra (Gold Label). It contained 2.24 % of ash, 16.7 % H_2O and a 1 % solution had $pH = 5.6$ at 20°.

SOLUBILITY OF GELATIN IN WATER.

(Mardles, 1930.)

One gram portions of Coignet's best quality gelatin leaf were allowed to soak in 100cc of water at the several temperatures with occasional shaking, for a period of one to two days. The supernatant solution was analyzed by precipitation with 2% tannic acid solution and estimating the content of gelatin from the volume of the precipitate centrifuged under controlled conditions.

t°	Gms. Gelatin per 100cc solution	t°	Gm. Gelatin per 100cc solution	t°	Gm. Gelatin per 100 cc solution
10	0.030	24	0.200	28	0.725
15	0.055	26	0.630	29	0.725
20	0.080	27	0.700	30	0.870

At 26° and above the swollen gelatin broke into small fragments and there is a possibility that a part of it dispersed in the gelatin solution in the form of a suspensoid. The results show that at about 26° a rapid rise in solubility occurs.

Solubility determinations with amounts of gelatin other than one gram per 100 cc are markedly different. Thus with 0.1 gm. gelatin per liter at 15° the solubility was found to be 0.005 gm. per 100 cc and with 4.0 gms. of gelatin per 100 cc it was 0.160 gm. per 100cc. The previous experiments of Mellanby, 1905, of Cohn, 1922, and of Sorensen, 1925, on this property of proteins are described.

The author also gives results on the rate of solution of gelatin, its precipitation from solution with falling temperature and the influence of additions of organic compounds on its solubility.

The following results were obtained for the solubility of gelatin dissolved from one gram portions by 100cc of water containing alcohol and glycerol respectively.

GELATIN

SOLUBILITY OF GELATIN IN WATER.

(Poutilov, 1935.)

Sheets of gelatin were weighed and immersed in water at constant temperature. After attainment of equilibrium, measured portions of the aqueous solution were removed and evaporated to dryness in weighed dishes and the residues dried at 90° – 100° and then in a desiccator and weighed. The gelatin sheets which were removed from the water were dehydrated with the aid of alcohol and of ether and weighed. They were then immersed in a fresh portion of water and the above procedure repeated. This was done for a third time.

The successive amounts of gelatin dissolved are as follows:

Weight of gelatin sheet	Gms. gelatin dissolved at 15° per 100cc solution			Gms. gelatin subsequently dissolved at 22° per 100cc solution
	1st	2nd	3rd	
0.5628	0.0752	0.0060	0.0013	0.1290
0.4382	0.0490	0.0047	0.0012	0.0942
0.4005	0.0421	0.0035	—	0.0821
0.2910	0.0399	0.0031	0.0005	0.0582

The gelatin after the third extraction with water at 15° was used for a similar experiment at 22° with results shown in the table. It was also found that although the residues obtained by evaporation of the solutions saturated at 15° redissolved completely in water, those from the solutions saturated at 22° did not redissolve. It was concluded that the gelatin which dissolves at 15° differs from that which dissolves at 22° and thus that micels of different chain length (mol. wt.) are present. The solubilities and the stability of the sols of gelatin depend upon the content of the fraction of lower molecular weight and increases in proportion to the amount of this fraction present in the gelatin. The author does not refer to the previous work of Mardles, 1930.

Attempts to determine the distribution coefficient of gelatin between water and cresylic acid (a mixture of cresols) are described by Woodman and Gallagher, 1929. The system is complicated by the fact that it yields emulsions. It is concluded that gelatin is in a colloidal condition in both solvents.

The curious circumstance was observed by Larson and Greenberg, 1933, that gelatin is soluble in 99.5% Acetic Acid only above certain concentrations and precipitates when the solution is diluted by the addition of more acetic acid. The minimum amount of gelatin which gave a clear solution with acetic acid at 20° was 3.1 gms. per 100 gms. of solution and 2.7 gms. at 25° . Above 80° there is no minimum amount which fails to dissolve. It was found that this curious behavior was not due to the presence of even as much as 5% of H_2O in the acetic acid.

KERATIN.

100 gms. H_2O dissolve 8.71 gms. keratin at 20 – 25° .
 100 gms. aq. 50% pyridine dissolve 16 gms. keratin at 20 – 25° .
 Pyridine mixes with keratin in all proportions at 20 – 25° .

(Dehn, 1917.)

" "

GLYCOGEN (C₆H₁₀O₅)_x

The solubility of glycogen at various alcohol and NaCl concentrations at 0° and at 22° was studied by Somogyi, 1934, for the purpose of finding the lowest alcohol concentrations applicable in the preparation and purification of glycogen

ALLOPHANATES of STEROLS.

Results for the solubility of allophanates of cholesteryl, dihydrocholesteryl, sito steryl, and of caprosteryl in ethyl ether; Petroleum ether, chloroform, dichlor ethane, benzene, toluene, ethyl alcohol, acetone and pyridine are given by Tange and McCollum, 1928.

FIBRINOGEN

Conditions of acidity and of temperature have been determined by Florkin, 1930 under which fibrinogen may be sufficiently purified of other proteins and its own denaturation products to yield a chemical individual of constant and reproducible solubility. Quantitative results are given for the solubility at 25° of purified fibrinogen in aqueous solutions of NaCl, K₂HPO₄, KH₂PO₄ + K₂HPO₄, and (NH₄)₂SO₄.

GLOBULIN (Serum).

SOLUBILITY IN AQUEOUS MAGNESIUM SULFATE SOLUTIONS.

(Galeotti, 1906; Scaffidi, 1907.)

The precipitated globulin (from oxblood) was not dried, but pressed between filter paper, and an excess introduced into each MgSO₄ solution. After constant agitation for 12 hours, the saturated solution was filtered, weighed and evaporated to constant weight, the coagulated globulin then washed to disappearance of SO₄ and dried and weighed.

The coagulation curve and freezing-point curve are also given.

Using serum albumin and serum pseudo globulin of beef blood, experiments on the variation of solubility with quantity of protein, the limiting solubility, the character of the heterogeneity of proteins and related problems are described by Bonot, 1934.

ALBUMIN (Egg).

100 gms. H_2O dissolve 100 gms. egg albumin at $20-25^\circ$. (Dehn, 1917.)

100 gms. pyridine dissolve 0.1 gm. egg albumin at $20-25^\circ$. "

100 gms. aq. 50% pyridine dissolve 6.29 gms. egg albumin at $20-25^\circ$.

(Dehn, 1917.)

Results for the solubility of egg albumin in aqueous solutions of ammonium sulfate at various temperatures are given by Sorensen and Hoyrup, 1915-17.

ALBUMIN (Egg)

**SOLUBILITY OF EGG ALBUMIN IN AQUEOUS 25 PERCENT
ETHYL ALCOHOL AT -5° .**

(Ferry, Cohn and Newman, 1936.)

The egg albumin was recrystallized from ammonium sulfate solutions as described by Sorensen, 1917, and subsequently dialyzed in a cellophane membrane to remove $(NH_4)_2SO_4$. Electro dialysis was also used. It was concentrated in negative pressure dialyzers and dried at about 2° in a vacuum over P_2O_5 . The solid albumin and the aqueous solvents were rotated from 5 to 7 days. The saturated solutions were filtered through sintered Jena glass filters in an atmosphere of Nitrogen under 15 pounds pressure. The content of protein in a weighed sample was determined by evaporation and weighing the residue in case no salt was present and by coagulating at 100° with 0.5 gm. K_2SO_4 , filtering, washing and weighing when salt was present. Four egg albumen preparations were used and the following average results obtained.

Gm. Mols. NaCl per liter Aq. 25 Vol. % C_2H_5OH	Gms. Egg Albumen dissolved per 1000 gms. solvent	Gm. Mols. NaCl per liter Aq. 25 Vol. % C_2H_5OH	Gms. Egg Albumen dissolved per 1000 gms. solvent

PLASMA PROTEINS

The evolution of our knowledge concerning the separation and identification of plasma proteins and determinations of their solubility in concentrated phosphate solutions are given by Butler and Montgomery, 1932. Determinations of the effect of pH, of temperature and of the removal of lipids on this solubility are given by Butler, Blatt and Southgate, 1935.

MYOGLOBIN

Determinations of the solubility of carboxy myoglobin, prepared from horse heart, in concentrated aqueous solutions of $(NH_4)_2SO_4$ at 25° and pH 6.6 are given by Morgan, 1935. The results may be expressed by the equation $\log S$ (Solubility) = $8.0-0.92$ (77_2) (the ionic strength per

HEMOGLOBIN.

100 gms. H₂O dissolve 15.16 gms. hemoglobin at 20-25°. (Dehn, 1917.)
 100 gms. pyridine dissolve 0.15 gm. hemoglobin at 20-25°. "
 100 gms. aq. 50% pyridine dissolve 0.77 gms. hemoglobin at 20-25°. "

100 gms. absolute alcohol dissolve 0.37 gm. hemoglobin at 20-25°. } (Pucher and)
 " quinoline " 0.23 " " " " } Dehn, 1921.)
 100 gms. equimol. mixture of alcohol and quinoline dissolve 0.59 gm. hemoglobin
 at 20-25°.

OXY HEMOGLOBIN

**SOLUBILITY OF OXYHEMOGLOBIN IN AQUEOUS POTASSIUM
PHOSPHATE SOLUTIONS AT 0°.**

(Cohn and Prentiss, 1927.)

			0.495	50.9	7.39			

The solubility of oxyhemoglobin is independent of the amount of protein in the solid phase. It dissolves in successive portions of the solvent to the same extent until the saturating body has been completely dissolved.

CARBOXYHEMOGLOBIN

**SOLUBILITY OF CARBOXYHEMOGLOBIN IN AQUEOUS ETHYL ALCOHOL
SOLUTIONS CONTAINING SODIUM CHLORIDE AT -5°.**

(Ferry, Cohn and Newman, 1938.)

The carboxyhemoglobin was prepared at 20° from horse erythrocytes and in order to be certain that it was always in the carboxy form it was saturated with CO whenever brought into solution. The carboxy hemoglobin was recrystallized from 25% ethyl alcohol. The saturated solutions were prepared in centrifuge tubes and 3 to 6 days rotation allowed for attainment of equilibrium. The dissolved carboxy hemoglobin was estimated by Kjeldal nitrogen determinations using the factor 16.86%

CARBOXY HEMOGLOBIN

SOLUBILITY OF CARBOXY HEMOGLOBIN IN POTASSIUM PHOSPHATE
SOLUTIONS OF pH 6.6 at 25°.

(Green, 1931.)

Mol. conc. per liter		Density	Gms. carboxy- hemoglobin per liter
$KH_2PO_4 + K_2HPO_4$	Mol. % K_2HPO_4		
1.072	52.6	1.1239	6.59
1.267	52.7	1.1453	2.59
1.267	52.7	1.1434	2.56
1.367	52.7	1.1574	1.64
1.462	52.1	1.1658	1.04
1.462	52.1	1.1646	1.05
1.657	52.7	1.1830	0.388
1.657	52.7	1.1843	0.438

Results at 0° similar to the above are given for carboxy-hemoglobin and for oxyhemoglobin. Results are also given for the solubility of carboxyhemoglobin at 25° in aqueous solutions of Na_2SO_4 , $(NH_4)_2SO_4$, $MgSO_4$ and Na citrate.

The author also reviews the literature of the salting out of proteins from aqueous solutions and discusses the exponential equations which have been proposed and tested for their applicability to this phenomenon. Horse hemoglobin was used in the present experiments since it is a chemical individual and is readily separated by crystallization and, being a globulin, can be studied both in dilute and concentrated solutions. Its mol. wt. is approximately 66,800. In later papers by Green, 1931, 1932, results are given for the solubility of horse carboxy hemoglobin in concentrated and in dilute potassium phosphate buffer solutions of varying pH at 25° and of the solubility of carboxy hemoglobin at pH 6.6 in aqueous solutions of NaCl, KCl Na_2SO_4 , K_2SO_4 , $MgSO_4$ and $(NH_4)_2SO_4$ at 25°.

In a very careful study of the solubility and dissociation tendency of carboxy hemoglobin of the horse in ammonium sulfate solutions, Sorensen and Sorensen, 1933, give results showing that the solubility of carboxy hemoglobin in ammonium sulfate solutions is expressed by the equation $\log s = \alpha.S + \beta$ proposed by Cohn. They also show that with changes in hydrogen ion activity the solubility curve shows two minima of which one is at about pH 6.6 (the isoelectric point of hemoglobin) and the other is at about pH 5.4, corresponding probably to a moderately difficult soluble hemoglobin sulfate of which the sulfuric acid content is about 12-13 mol. per mol. of hemoglobin hydrate.

Determinations by Green, Cohn and Blanchard, 1935, of the solubility of Human hemoglobin in concentrated salt solutions show that it remains dissolved in a phosphate solution in which horse hemoglobin is essentially insoluble. Human hemoglobin behaves much more like an albumin than does horse hemoglobin. The maximum solubility of the latter is 0.052 gm. per liter in 0.33 molar phosphate buffer at pH 6.6 at 25°. Human hemoglobin is as soluble as this in 1.96 molar phosphate buffer, but at this ionic strength the hemoglobin of the horse is only one-thousandth as soluble as that of man.

CHOLESTEROL-DIGITONIDE.

SOLUBILITY IN WATER AND IN ETHYL ETHER. (Mueller, 1917.)

The compound was prepared by precipitating recrystallized cholesterol, made from gall stones, by digitonin, filtering, washing-throughly with alcohol and ether and drying. Some of the resulting compound was shaken with ether for 24 hours at room temperature. After filtering, exactly 100 cc. were evaporated in several portions from a small weighed porcelain dish, the residue was dried at 110° and weighed. The average of 3 determinations gave :

0.0007 gm. Cholesterol-Digitonide per 100 cc. of ether.

Similar determinations, using boiling water as the solvent, gave :

0.0006 gm. Cholesterol-Digitonide per 100 cc. of H_2O .**PEPTONE.**

100 gms. H_2O	dissolve 42.2	gms. peptone at $20-25^{\circ}$.	(Dehn, 1917.)

NAME INDEX (1)

Acenaphthalide in H ₂ O and aq. EtOH.....	705	+ pyridine + aniline + H ₂ O.....	105
Acenaphthene in alcohols and other		+ toluidine + H ₂ O.....	556
solvents.....	697	f.pt.data.....	117
f.pt.data.....	697	di chloro in H ₂ O(f.pts.)(ref.).....	77
c.s.t.data.....	584	Dist.results.....	78-9
bromo, chloro etc.f.pt.data.....	693	+ C ₆ H ₆ + H ₂ O.....	77
nitro, f.pt.data.....	695	f.pt.data.....	79
Acetaldehyde f.pt.with EtOH and other		ethyl ester(See Ethyl Acetate)	
cmpds.....	100	tri chlor in H ₂ O.....	68
tri thio in several solvents.....	434	Dist.results.....	68-70
Acetamide in H ₂ O, EtOH and other		+ C ₆ H ₆ + H ₂ O.....	68
solvents.....	120, 121	f.pt.data.....	71
c.s.t.with other cmpds.....	67, 121	tri phenyl in aq.acetic acid.....	801
f.pt.data.....	122	Acetic anhydride + acetone + glycerol.....	177
tri bromo f.pt.data.....	77	+ CS ₂	222
Acetanilide, in H ₂ O, EtOH and		+ cyclohexane.....	222
other solvents.....	600-603	+ petroleum.....	222
in aq.solutions.....	601	f.pt.data.....	223
in mixed solvents.....	603-5	Acetin(mono, di and tri) Dist.bet.	
Dist.results.....	605	H ₂ O and oil(ref.).....	307
f.pt.data.....	605	Acetone in aq.sols.of salts and sugar	175-6
acetoxyl, in H ₂ O and CHCl ₃	668	c.s.t.with cyclohexane(ref.).....	54
Dist.results.....	668	Dist.results.....	181-2
bromo f.pt.data.....	576, 580	in EtOH(f.pts.).....	155
chloro, bromo etc.in acetic acid.....	576	+ acetic anhydride + glycerol.....	177
f.pt.data.....	576	+ benzene.....	184
chloro in H ₂ O, EtOH and C ₆ H ₆	581	+ benzene + H ₂ O.....	179
in aq.sols. of acids and salts.....	581	+ bromo benzene + H ₂ O.....	176
di nitro, f.pt.data.....	577	+ butyl alcohol + H ₂ O.....	177-8
methyl in aq.acetic acid.....	636	+ carbon disulfide.....	10-11
f.pt.data.....	636	+ chloroform.....	184
nitro, in H ₂ O and C ₆ H ₆	597	+ chloroform + H ₂ O.....	14-176
in aq.solutions.....	597-8	+ di iso amylene.....	180
f.pt.data.....	598	+ ethyl ether.....	184
oxy methyl, in H ₂ O.....	639	+ furfural + H ₂ O.....	179
Acetanilidine in H ₂ O.....	639	+ glycerol + H ₂ O.....	177
Acetic acid in H ₂ O and in EtOH(f.pts.).....	101	+ glycerol.....	180
in aq.sols.of acids, etc.....	102	+ glycol + another cmpd.....	157-8
Dist.results.....	103-114	+ naphthalene + H ₂ O.....	649-50
+ aniline.....	115, 412-3	+ phenol + H ₂ O.....	378
+ " + H ₂ O.....	104-5	+ toluene + H ₂ O.....	180
+ CCl ₄ + H ₂ O.....	2	f.pt.data.....	184
+ CS ₂ + cyclohexane + petroleum.....	116	di anisal, f.pt.data.....	795
+ cotton seed oil.....	116	di benzyl, f.pt.data.....	768
+ ethyl ether + H ₂ O.....	102	phenyl hydrazone in H ₂ O.....	642
+ nitroso benzene.....	116	Acetonitrile in H ₂ O(f.pts.).....	85
+ kerosene.....	116	c.s.t.data.....	66, 85
+ piperidine + pyridine + H ₂ O(ref.).....	307	+ CS ₂	10
+ pyridine.....	115	f.pt.data.....	85

(1) The following abbreviations are used in the name index.

alc.—alcohol

f.pt.(s)—freezing-point(s)

NAME INDEX

Acetophenetide in aq.EtOH.....	671	Alanines in H ₂ O and aq. sols.....	198-9
in several solvents.....	670-1	in aq.EtOH.....	199-200
f.pt.data.....	671	Dist.results.....	200
di methoxy in H ₂ O.....	709	phenyl in H ₂ O.....	639-640
Acetophenone in aq.Na oleate.....	579	hydantoic acid in H ₂ O and EtOH.....	262
in glycerol.....	579	Alazine, thiophenyl, f.pt.data.....	747
f.pt.data.....	579	Albumin(egg) in H ₂ O and pyridine.....	847
amino, f.pt.data.....	606	in aq.EtOH.....	847
anisal amino, f.pt.data.....	757	in aq.(NH ₄) ₂ SO ₄ (ref.).....	847
benzal, f.pt.data.....	756	(serum) in aq.sols. (ref.).....	846
bromo, methoxy benzal, in EtOH and		Aldehyde, Dist.results.....	441
lignoin.....	761	Aldehyde benzoic acids in H ₂ O and C ₆ H ₅ 71-2	
chloro f.pt.data.....	576	Alizarine in H ₂ O and aq. sols.....	736
cinnamylidene, f.pt.data.....	768	in EtOH.....	733
ethoxy benzal, f.pt.data.....	769	in several solvents.....	736
methylene dioxy benzal f.pt.data....	760	Allantoin in H ₂ O and aq.sols.....	223
oxy benzal, f.pt.data.....	756	Allocholic acid, f.pt.data.....	822
piperonal, f.pt.data.....	760	Allocinnamic acids in H ₂ O.....	625
Acetotoluide in aq.EtOH.....	636-7	Allo ergostan, f.pt.data.....	823
in various solvents and their		Allophanates, ethyl, methyl etc. in EtOH	
mixtures.....	637	and in ethyl ether.....	263
Acetoxy acetanilide in H ₂ O and CHCl ₃ ...	668	Allophanates of sterols in various	
Dist.results.....	668	solvents (ref.).....	846
Acetylene in H ₂ O.....	71	Alloxane in H ₂ O and aq.sols.....	218
in aq.sols. of salts etc.....	72-4	Alloxantin in H ₂ O and aq. sols.....	406
in blood, serum etc.....	71-4	Allylamine, Dist.results.....	198
in organic solvents.....	75-6	cyanide, f.pt.data.....	218
f.pt.data.....	73-4	Allylene in mer(f.pta.).....	169
di iodide, f.pt.data.....	77	Allyl iso sulfocyanide in HCOOH.....	32
di phenyl, f.pt.data.....	744	+ CS ₂	10
ethyl tetra carbonate, f.pt.data.....	754	f.pt.data.....	218
methyl tetra carbonate, f.pt.data....	676	mustard oil in sulfur.....	221
tetra bromide.....	76	in ternary and quaternary systems221	
Acetylidene tetra chloride in H ₂ O.....	77	f.pt.data.....	221
Acetyl acetone in H ₂ O.....	292	phenyl thio urea in several solvents669	
amino antipyrine, f.pt.data.....	728	f.pt.data.....	669
amino naphthalene sulfonates of		thio urea in H ₂ O and EtOH.....	243
aryl amines in aq.acetic acid(ref)708		f.pt.data.....	243
coumaric acid in H ₂ O.....	689	Alain in H ₂ O and other solvents.....	829
coumarinic acid in H ₂ O.....	689	Amino acetophenone f.pt.data.....	606
diethyl tartrate, f.pt.data.....	709	anthraquinones in EtOH.....	793
phenylene diamines in H ₂ O and C ₆ H ₆ . 608-9		antipyrine, acetyl, f.pt.data.....	728
propionic acid, Dist.results.....	292-3	azo benzene, Dist.results.....	705
salicylic acid, in H ₂ O and other		f.pt.data.....	705
solvents.....	630	benzene sulfonic acids in H ₂ O.....	422-3
Dist.results.....	630-1	in aq.salt sols.....	423
Aconitic acid in HCOOH.....	406	benzoic acid in H ₂ O and other	
Aconitine in H ₂ O and other solvents....	828	solvents.....	538-9
Acridine, f.pt.data.....	720	in aq.salt sols.....	539
Acridium hydroxide, phenyl methyl in H ₂ O		Dist.results.....	540
and aq. solutions.....	801	in organic solvents.....	540-1
Acraflavine in H ₂ O.....	150	f.pt.data.....	541
Acrolein in H ₂ O.....	165	Amino benzo phenone, f.pt.data.....	725

NAME INDEX

bromo fluorenol in several solvents.721	Aniline in H ₂ O.....406-7
butyric acid in aq.EtOH.....265	in aq. salt sol's.....407-12
Dist.results.....265	in aq.EtOH.....413
butyric hydantoin in aq.EtOH.....292	in aq.sol's. of acids and other
caproic acid in H ₂ O.....453	cmpds.....412-5
in aq.EtOH.....455-6	Dist.results.....416-7
in several solvents.....456	+ acetic acid + H ₂ O.....104-5,412-3
Dist.results.....456	+ acetic acid.....115
caproic hydantoic acids in H ₂ O.....	+ amylene.....298
and other solvents.....566	+ cyclohexane.....417-8
di methyl antipyrine in H ₂ O.....728	+ formic acid + H ₂ O.....26
f.pt.data.....729	+ hexane.....417
di methyl azobenzene in aq.CH ₃ OH...753	+ hydro carbons.....419
in ethyl ether.....753	+ oils + H ₂ O.....415
f.pt.data.....753	+ phenol(f.pt.s.).....417
di methyl benzoic acid f.pt.data...639	+ phenol + H ₂ O.....415
iso butyric acid in aq.EtOH.....265	+ piperidine + H ₂ O.....307
methyl anthraquinone f.pt.data.....756	+ pyridine + H ₂ O.....288
naphthol sulfonic acid in H ₂ O.....664	+ pyridine + CH ₃ COOH + H ₂ O.....105
nitro benzoic acids in EtOH and	+ sulfur.....417
ethyl ether.....533	C.s.t.data.....418,433,457
Amino phenols in H ₂ O and C ₆ H ₆421	f.pt.data.....419
f.pt.data.....422	
propionic acid in H ₂ O and aq.salt	Aniline,benzal in CS ₂724
solutions.....198-9	f.pt.data.....724
in aq.EtOH.....199-200	benzyl,f.pt.data.....727
Dist.results.....200	bromo,nitro di methyl f.pt.data....606
succinic acid in H ₂ O and aq.EtOH.239-40	bromo sulfonic acids in H ₂ O.....405
f.pt.data.....240	chloro nitro di methyl f.pt.data....606
valeric acid,Dist.results.....309	chloro sulfonic acids in H ₂ O.....405
valeric hydantoic acid in H ₂ O and	chloro stannate in H ₂ O.....420
EtOH.....442	ethyl,C.s.t.data.....615
	f.pt.data.....615
Amygdalin in tri chlor ethylene.....811	helianthate in H ₂ O.....420
Amylene(tri methyl ethylene) in liquid	hydro chloride in H ₂ O.....420
CO ₂298	Dist.results.....420
in aq.Na salicylate.....298	iodo sulfonic acid in H ₂ O.....406
+ aniline.....298	nitro di methyl in aq.HCl(ref).....610
hydrate,Dist.results.....315	nitro ethyl f.pt.data.....610
Amylose,tri and hexa in H ₂ O.....783	nitro benzene sulfonate in H ₂ O.....707
Amyl acetate in H ₂ O.....564	nitroso di ethyl f.pt.data.....677
in EtOH + H ₂ O.....565	nitroso di methyl f.pt.data.....609
alcohol in H ₂ O and aq.alcohols...313-4	nitroso ethyl f.pt.data.....609
amine in H ₂ O(f.pt.s.) (ref.).....317	nitroso propyl f.pt.data.....642
Dist.results.....317-8	oxalate in H ₂ O and aq.EtOH.....420
butyrate in H ₂ O.....644	sulfate in H ₂ O.....420
cumaric acid in H ₂ O.....754	sulfonic acids in H ₂ O.....420
cumarinic acid in H ₂ O.....754	tri chlor acetate in H ₂ O.....588
formate + EtOH + H ₂ O.....436	tri methyl f.pt.data.....642
Amyl malonic acid in H ₂ O and C ₆ H ₆618	tri nitro di ethyl in H ₂ O.....670
methyl ketone in H ₂ O.....564	tri nitro ethyl in H ₂ O.....599
propionate in H ₂ O.....620	Anisaldehyde in liquid NH ₃588
valerianate,C.s.t.data.....198	f.pt.data.....588
Andromedotoxine in H ₂ O and other	Anisalamino acetophenone f.pt.data....757

+ phenol + H_2O385	Tri azine, methyl diphenyl f.pt.data...761
Dist. results.....674	tri phenyl f.pt.data.....780
f.pt.data.....675	Tri benzyl amine HCl in H_2O554
Thymo quinone f.pt.data.....670	in $CHCl_3$552
Tolan f.pt.data.....744	Tri bromo, chloro, nitro, etc. See Bromo
Tolidine(nitro)benzene sulfonate in H_2O 707	(tri), Nitro(tri) etc. and also the
Tolualdehydes, hydroxy in H_2O584	parent compound
in C_6H_6585	Tri butyrin in C_6H_6 (ref).....257
Toluene in H_2O542	Tri caprin in several solvents.....685
in aq. Na oleate.....543	Tri caproin in C_6H_6 (ref).....440
in $HCOOH$25	Tri caprylin in C_6H_6 (ref).....620
in sulfur.....543	Tri ethyl amine in H_2O466-7
f.pt.data.....543	in aq. sols (ref).....467
+ acetone + H_2O180	in aq. EtOH.....467
+ bromoform.....12	+ benzil + H_2O (ref).....745
+ EtOH + H_2O442-4	+ CS_210
+ EtOH + glycol.....154	+ ethyl ether + H_2O (ref).....467
+ glycol + acetone.....157	+ formic acid.....92
+ methyl alcohol + H_2O50	+ mannitol + H_2O464
diamine in rubber (ref).....560	+ naphthalene + H_2O (ref).....467
Toluene sulfonamides in H_2O560	+ phenol + H_2O (ref).....467
f.pt.data.....560	+ sucrose + H_2O (ref).....467
sulfonanilide, in aq. acetic acid....777	Dist. results.....467-8
sulfonanilide, methyl in aq. acetic	f.pt.data.....468
acid.....754	hydrochloric acid in H_2O468
sulfonic acids in aq. H_2SO_4552	in $CHCl_3$468
sulfonyl chlorides f.pt.data.....542	Tri ethyl phosphine sulfide f.pt.data...466
Toluic acids in H_2O581-2, 586	sulfonium iodide in H_2O466
in aq. sols.....582, 586	in $CHCl_3$466
in org. solvents.....581-2, 584, 587-8	Tri glycine in aq. EtOH.....432
Dist. results.....582-3, 587	hydantoic acid in H_2O562
C.s.t.data.....584	in EtOH.....562
f.pt.data.....584, 588	Tri hydroxy benzoic acid Dist. results...533
hydroxy, in H_2O598	Tri laurin in EtOH and quinoline.....717
in other solvents.....599	in several solvents.....718
Toluidines in H_2O554-5	Tri methyl amine in H_2O (ref).....210
in aq. sols.....555, 558	in various solvents.....211
in several solvents.....560	Dist. results.....211-2
+ acetic acid + H_2O556-7	acid phthalate Dist. results.....213
+ cyclohexane.....433	chloro platinate in aq. EtOH.....212
+ EtOH + H_2O144	Tri methyl butane C.s.t.data.....418
+ glycerol.....210	carbinol f.pt.data.....271
Dist. results.....557-8	ethylene (Amylene) in aq. Na salicylate 298
C.s.t.data.....559	in liquid CO_2298
f.pt.data.....559	+ aniline.....298
helianthates in H_2O816	glycocol (Betaine) in H_2O309
(nitro)benzene sulfonate in H_2O707	in alcohols.....309
tri chlor acetate in H_2O635	sulfine per chlorate in H_2O213
Toluido methyl anthraquinone in EtOH...733	Tri methylene cyanide (Glutaronitrile)
Toluol diazonium phosphor hexa fluoride	in H_2O290
in H_2O535	glycol esters in EtOH.....791
Tolyl amine, phenyl f.pt.data.....727	tri nitramine in several solvents...196
Tolyl (di)amine f.pt.data.....722	

NAME INDEX

Tri myristin in several solvents.....	755	Undecylic acid f.pt.data.....	691
Tri nitranisole in H ₂ O.....	495	Undecyl malonic acid in C ₆ H ₆	754
in org.solvents.....	495	Uramido valeric acid in H ₂ O.....	442
f.pt.data.....	496	in EtOH.....	442
Tri nitro benzene in H ₂ O.....	323	Urea (Carbamide) in H ₂ O.....	55
in aq.EtOH.....	323	in aq.acids.....	56-9
in org.solvents.....	323	in alcohols and other solvents.....	58-61
f.pt.data.....	324	+ ammonia + H ₂ O(ref).....	59
cresol f.pt.data.....	495	+ ammonium carbonate + H ₂ O(ref)...	59
phenol (Picric acid) in H ₂ O.....	324-5	+ benzoic acid + EtOH.....	60
in aq.sols.....	325-7, 329	+ ethyl ether etc.....	61
in aq.alcohols.....	328-9	+ diphenyl amine(ref).....	61
in solvent mixtures.....	334-9	+ diphenylamine + resorcinol(ref)...	61
Dist.results.....	330-2	+ quinoline + EtOH.....	61
f.pt.data.....	338	benzyl, tolyl and methyl phenyl in	
resorcinol in glycol diacetate.....	339	H ₂ O and other solvents.....	608
toluene in H ₂ O.....	492	Urease in buffer sols.(ref).....	850
in conc.H ₂ SO ₄	494	Ureides in H ₂ O and in oil.....	432
in org.solvents.....	492-3	Ureide of Glucose in alcohols.....	564
f.pt.data.....	494	Urethan (Ethyl carbamate) in H ₂ O.....	202
Tri olein f.pt.data.....	787	in aq.sols.....	203
Trional in H ₂ O.....	568	in org.solvents.....	203
in serum.....	622	f.pt.data.....	203-4
in EtOH.....	568	derivatives in H ₂ O.....	203
Dist.results.....	317, 622	Dist.results.....	203
Tri palmitin in several solvents.....	766	butyl in H ₂ O.....	566
Tri phenyl acetic acid in aq.acetic		ethyl in H ₂ O.....	311
acid.....	801	phenyl f.pt.data.....	639
amine in alcohols.....	780	Uric acid in H ₂ O.....	282
in Cs ₂	705	in aq.acids.....	283
f.pt.data.....	780	in buffer sols.....	284-5
Tri phenyl arsine etc., f.pt.data.....	780	in aq.salt sols.....	285
benzene f.pt.data.....	821	in EtOH and other solvents.....	286
carbinol in C ₆ H ₆	795	Urson in EtOH and ether.....	826
f.pt.data.....	795	Valerates See Ethyl, Iso ethyl etc.	
carbinol, tetra methyl diamino f.pt.		Valeramides Dist.results.....	309
data.....	819	Valeric acid (Propyl acetic acid) in	
guanidine in aq.EtOH.....	795	H ₂ O.....	301
f.pt.data.....	795	+ CCl ₄ + H ₂ O.....	3
methane in org.solvents.....	792-4	+ hexane + nitrobenzene.....	458
in liquid SO ₂	792	Dist.results.....	301-2
f.pt.data.....	794	f.pt.data.....	306
Tri stearin in several solvents.....	790	Valeronitrile f.pt.data.....	294
f.pt.data.....	790	Valine in H ₂ O and EtOH.....	310-11
Tri tolyl arsine f.pt.data.....	534	Dist.results.....	311
Tropacocaine in H ₂ O.....	776	Vanillin in H ₂ O.....	589
Tropic acid in H ₂ O.....	635	in aq.glycerol.....	590
Tryptophan in H ₂ O.....	689	in aq.EtOH.....	589
in aq.sols.....	689	in several solvents(ref).....	590
in org.acids.....	689	Dist.results.....	589
Turpentine in EtOH.....	837	f.pt.data.....	590
+ methyl sulfate.....	159	Veratrine in H ₂ O and other solvents...	827
Tyrosine in H ₂ O.....	640	Veratrole f.pt.data.....	609
in aq.sols.....	641	Veronal in H ₂ O etc...	616

NAME INDEX

Vinyl chloride(chloro ethylene) in several solvents.....	84	in thymol.....	673
di methyl sulfine perchlorate in H_2O	213	in toluene.....	543
phenyl carbinol nitro benzoate f.pt.data.....	761	in toluidine.....	555
tri chloride in H_2O	84	in tri methyl pentanol.....	622
f.pt.data.....	84	in xylene.....	607
Volatile oils in aq.EtOH.....	832	Waxes in various solvents.....	833
Voluntal(tri chlor ethyl carbamate) f.pt.data.....	165	Xanthaline picrate in H_2O	829
phenyl f.pt.data.....	630	in org. solvents.....	829
Water in amyl alc.....	313	Xanthenone in CCl_4 and $CHCl_3$	719
in benzene.....	368	f.pt.data.....	719
in butyl acetate.....	437	Xanthogen succinimide in H_2O	561
in CCl_4	2	Xanthone in CCl_4 and $CHCl_3$	719
in $CHCl_3$	13	f.pt.data.....	719
in CS_2	10	Xylene in H_2O and EtOH.....	607
Water in cyclohexane.....	54, 432	+ acetone + glycol.....	157
in dimethyl pyridine.....	553	+ EtOH + H_2O	145
in diphenyl amine.....	702	+ EtOH + glycol.....	154
in epichlor hydrine.....	169	in $HCOOH$	25
in ethyl acetate.....	244-5	f.pt.data.....	607, 614
in ethyl ether.....	272	di nitro f.pt.data.....	599
in iso amyl alc.....	314	melta nitroso f.pt.data.....	599
in isomeric hexanols.....	460	tri nitro in several solvents.....	578
in methyl amyl ketone.....	564	f.pt.data.....	578
in methyl alcohol.....	54	Xylenol in aq.sols.....	607
in methyl piperidine.....	452	f.pt.data.....	608
in methyl propyl ketone.....	298	Xylidenes in H_2O	615
in nitro methane.....	36	Dist.results.....	615
in nitro toluene.....	537	f.pt.data.....	615
in paraldehyde.....	441	(nitro)benzene sulfonate in H_2O	707
		Xilitol dibenzallic in org. solvents....	465
		Xyloquinone in EtOH and quinoline.....	585
		Yohimbine in H_2O and EtOH.....	816
		Zein in aq.EtOH.....	839
